Description

The Model 740, 741, and 743 SC Series LED Keypads are the industry's finest sub-control keypads with integrated access control capabilities. The keypads operate as a stand-alone system that provides arming, disarming, local alarm notification, Wiegand input, and access control. When connected to the LX-Bus™ of an XR200 or XR200-485, the keypad's local zones are supervised for alarm annunciation.

Each keypad provides three local zones for burglary and one zone for non-powered fire devices or a panic button. Also provided are a 2-button Panic key, three system status LEDs, three armed status LEDs, four zone LEDs, a backlit keyboard with easy to read lettering, and an internal speaker/siren.

The 741 and 743 keypads include a standby battery backup circuit, a Wiegand input, and one Form-C relay. Additionally, the 743 includes an internal Wiegand proximity reader.

Zone Supervision

The keypad can only be connected to an LX-Bus for zone supervision then reports the open, normal, or short condition of the local keypad zones to the panel. The keypads programmed address is used as a starting point to report the conditions of local zone 1 to the corresponding LX-Bus panel zone (Ex. address 75 = LX-Bus zone 175). Local zone 2, 3, and 4 conditions are reported on the next three panel zones (Ex. zone 2 = 176, zone 3 = 177, zone 4 = 178). Additionally, the keypads may be programmed to report an alarm from any of the four zones on only one LX-Bus zone. The corresponding LX-Bus panel zones must be programmed and then armed to create an alarm when the local zone reports a **short** to the LX-Bus. A normal zone condition is continuously sent to the LX-Bus when the keypad is disarmed and when a zone is automatically swinger bypassed (3 trips during the armed period).

Internal Speaker/Siren

When an alarm occurs, the internal speaker can be programmed to emit loud and distinct burglary or fire siren tones. Also, the keypads emit tones for key presses, entry delay, system alerts, and zone monitor.

After the user performs a successful keypad operation, such as disarming the system, the speaker emits a 1/2 second tone. If the operation is not successful, the speaker emits four short tones. This alerts the user to perform the function again.
Bell Circuit

A switch ground circuit, rated for 500mA, is provided to switch power for alarm bells or horns. This output turns on steady for burglary alarms and temporal 3 cadence for fire alarm.

Form C Relay

The 741 and 743 keypads provide one internal Form C (SPDT) relay. This relay may be used for a variety of functions based on programming. It may be used for:

- Access Control - connect to door strikes or magnetic locks.
- Alarm Relay - connect to an external annunciator.
- Sensor Reset - connect to power of 4-wire smoke detector.

The Form C relay draws up to 30mA of current and its contacts are rated for 1 Amp at 24 VDC.

Wiegand Input

A Wiegand style card reader may be attached to the 741 and 743 SC Series keypads. Connect Black power wire from the reader in parallel to the black ground wire of the keypad. Connect the White data wire from the reader (Data 1) to the White wire on the Output/Reader harness. Connect the Green data wire from the reader (Data 0) to the Green/White wire on the Output/Reader harness.

Below are the specifications for individual readers:

MP-5365 MiniProx® Proximity Reader -   60mA at 12VDC

PR-5355 ProxPro® Proximity Reader -   60mA at 12VDC

TL-5395 ThinLine II™ Switchplate Reader -   60mA at 12VDC

580 Magnetic Stripe Card Reader -   50mA at 12VDC

2-Button Panic Keys

The Panic key function of the 740, 741, and 743 keypads allow users to send Panic or Fire reports to the supervising alarm panel. The user must press and hold the two SELECT keys for two seconds until a beep from the keypad is heard. At the beep, the keypad simulates a short on zone 4. Zone 4 programming determines whether the keypad sends a Panic report or a Fire report.

The Panic key function must be programmed if the Panic keys are to be used. See the "**Programming the keypad**" section for instructions. Cut the icon label for the appropriate function and install the icon label below the top row of Select keys.
Panic key label placement

Main DC Power

The SC Series keypads require an external 12 VDC power source to operate. The DC power source must be capable of supporting each keypad based on the following chart. Additional current capacity is required when a backup battery is connected.

Model	Voltage	Current		
		Normal	**Alarm**	**Battery Backup**
740	8 to 18 VDC	50 mA	100 mA	N/A
741	8 to 18 VDC	50 mA	130 mA	200 mA
743	8 to 18 VDC	70 mA	160 mA	200 mA

Battery Backup

When using the 741 or 743 keypads, the Red/Black wire provides a maximum 200mA output to charge a backup battery. The 741 and 743 include 14" battery leads for connection to a maximum 4Ah battery. The Red/Black wire on the 740 **does not** provide any voltage output.

Main DC Input	Battery Backup Output
16 - 18 VDC	13.8 VDC regulated
15 VDC	13.5 VDC
14 VDC	12.5 VDC
13 VDC	11.5 VDC

The battery backup output voltage varies based on the Main DC input voltage as shown below.
Installing the keypad

The SC Series keypads each use the same plastic housing and are designed to easily install on any 4 square box, 3-gang switch box, 695 and 696 backbox, or flat surface. The Keypad Mounting Template below shows the mounting hole location and reference card location on the keypad base. Use this template as a guide for mounting the keypad.
Wiring the keypad

The keypads are each supplied with one 12-wire Data Bus /Zone harness. The 741 and 743 also include one 5-wire Output/Reader harness. The harness connections and color codes are shown in the keypad harness wiring diagram.

Once all the wire connections are made, mount the keypad using appropriate size anchors and the enclosed screws.

Data Bus/Zone Harness

Red - Keypad Main DC Power Input
Yellow - Send Data to LX-Bus
Green - Receive Data from LX-Bus
Black - Ground
Zone 1 White/Brown
Zone 2 White/Red
Zone 1, 2, and 3 Ground Black/White
Zone 3 White/Orange
Zone 4 High White/Yellow
Zone 4 Low Yellow/White
Battery Backup Red/Black
Bell Switched Ground Blue

Violet - Relay Normally Closed
Gray - Relay Common
Orange - Relay Normally Open
White - Wiegand Data 1
Output/Reader Harness
Green/White - Wiegand Data 0

Keypad harness wiring

Keypad Reference Card

Insert the reference card between the two guide tabs *before* installing the keypad.

Surface and backbox mounting holes.

Surface and backbox mounting holes.

Write the zone descriptions on the front of the card *before* inserting the card into the keypad.

Wire harness entrances

Combined 4 square and 3-gang switch box mounting holes.

Surface and backbox mounting holes.

Keypad Mounting Template

Gently twist while pulling halves apart. Repeat at other opening.

Programming the keypad

The SC Series keypads provide a **Program Mode** that allows installers to configure the keypad.

How to get in

You access the **Program Mode** by pressing 6,6,5,3 (PROG) followed by a four digit (default = 0000) programming access code. Once you have accessed the Program Mode you are ready to select the various keypad programming options available. During programming the Trouble LED will pulse to indicate Program Mode. To enter a programming option press the SPECIAL key followed by the option number (see the Programming Option Table). Enter the selection for that option. After the selection is entered the keypad will beep once to accept the programming. If an invalid character is entered, the keypad will beep four times and exit the option.

Programming Readout

When a programming option is chosen (SPECIAL XX), the current setting for the option is immediately indicated on the Zone 1 LED.

A single programmed digit pulses the Zone 1 LED (1/3 second ON, 1/3 second OFF) the number of times necessary to indicate digit one through nine. For the zero digit, the LED turns on for 1.5 seconds.

For multiple programmed digits, the Zone 1 LED pulses (1/3 second ON, 1/3 second OFF) the number of times to equal the first digit. The LED turns off for two seconds, then the LED pulses (1/3 second ON, 1/3 second OFF) the number of times to equal the second digit. When a programmed option uses two digits but the first digit is zero, only the second digit will be displayed.

Option 1 Program Initialization

This option sets all programing options except Programming Access Code to their factory default values. Press 1 and hold for two seconds until keypad beeps once.

Option 2 Clearing User Codes

To clear all user codes from the memory, press 1 and hold for two seconds until keypad beeps once. All user codes are now cleared and user code 0099 (99 CMD) is placed in user number eight.

Option 3 Bus address

Set the bus address from 00 to 99. It is not necessary to enter a leading zero for addresses 01 to 09.

Option 4 LX-Bus Communication

This option allows communication of local zone conditions to a supervising XR200 or XR200-485. Enter 0 (none) when zone conditions are not sent to the supervising panel. Enter 1 (711 style) when all four local zone conditions are combined as one zone on the LX-Bus. Enter 4 (714 style) when each local zone condition is individually sent on four consecutive addresses of the LX-Bus.

Option 5

This option reserved for future use.

Option 6

This option reserved for future use.

Option 7 Bell Cutoff Time

This option selects the maximum time in minutes (0-15) that the Bell Output will allow a bell or siren to sound. If the Bell Output is manually silenced or the system is disarmed, the cutoff time is reset. Enter 0 to provide continuous bell output with no cutoff.

Options 8, and 9 Exit and Entry Delays

These options set the delay time (0-99 seconds) for Exit Delay and Entry Delay. When the system is armed, the Exit Delay time starts and any activity on Burglary Zones is ignored until the exit delay expires. For an Entry Delay, the system must be disarmed before the delay expires or an alarm condition will occur. Select the amount of time desired for each delay.

Option 10 Internal Speaker/Siren Annunciation

This option enables the internal speaker to turn on siren tones for an alarm anytime the Bell Output is turned on. Enter 1 to enable internal speaker/siren annunciation.

Options 11 Panic Keys

Select 1 to allow two-button panic key operation. Enter 0 to inhibit panic key operation.

Option 12 Zone 4 Panic or Fire Selection

This option determines Zone 4 operation as either a Panic or Fire zone. Choose either option 1 for Panic zone without the Bell Circuit and without LED alarm status (silent), or 2 for Panic zone with Bell Circuit and LED alarm status, or 3 to select this zone as a Fire zone.

Option 13 Relay Action

This option is only available in the 741 and 743 keypads and determines the keypad relay output operation. Enter 1 for alarm relay, 2 for door access relay operation, or 3 for sensor reset. When configured as alarm relay, the relay turns on anytime the Bell Output turns on.

Option 14 Battery Test

Enter 1 when installing a 741 or 743 keypad and battery backup voltage monitoring is desired. Low battery is detected at 11.9 VDC.

Option 15

This option reserved for future use.

Option 99 Programming Access Code

This option sets the four digit code (0000-9999) for a programming access code.

Option 00 Exiting the Program Mode

When programming is completed, press the SPECIAL key and 00 to terminate the **Program Mode**. The **Program Mode** will be terminated if no key is pressed for one minute.

Programming Access Code Initialization

The 740, 741, and 743 keypads can be initialized to reset the programming access code to the factory default (0000). To reset the programming access code:

- Disconnect the Red wire from the 12VDC power source and disconnect the Red/Black battery wire.

- Disconnect the Yellow (data transmit) and the Green (data receive) wires from the LX-Bus.

- Twist the Yellow and Green keypad wires together.

- Reconnect the Red wire to the 12VDC power source.

The keypad programmer code is now reset to 0000. Reconnect wires properly.
