DVAC Reporting Types 23

PC5010 & PC5015 DVACS Default Reporting Codes 27

System Introduction

S E C T I O N 1

Features

The PC5720 is a fire module that can be used for ULC-listed non-residential fire applications. The PC5720 can also be used as an interface between the control panel and either a serial printer or a DVAC communications network.

Module Specifications

- 4-wire (QUAD) hook-up to the Keybus
- Current draw: 80mA standby; 100mA with printer, 120mA with F1/F2-L3
- Tamper and Trouble reporting codes
- Maximum cable length: 200 feet (61 meters)
- Eight zone inputs: one ground fault detection zone, two normally open Class A loops and five standard Class B loops.

PC5720 connected to a serial printer

- True RS-232 technology
- DTR protocol
- Four possible baud rates: 300, 1200, 2400 or 4800

PC5720 connected to a DVACS network

- Automatic programming for extended DVACS reporting codes.
- Monitoring for DVACS line fault
- Module self diagnostics

Compatible Products

- PC5010
- PC5015

Getting Started

S E C T I O N 2

Mounting the Cabinet

When mounting a new cabinet for the PC5720, select a dry location close to where the serial printer will be located (if used), or near the F1/F2 subset if DVACS communications is to be used.

To mount the cabinet:

1. From the back of the cabinet, press in the four white circuit board stand-offs into the raised mounting holes.
2. Holding the cabinet in position, pull all wiring into the cabinet through the hole in the back.
3. Using the provided mounting screws and appropriate wall anchors, mount the cabinet securely to the wall.
4. Press the PC5720 module onto the plastic stand-offs.

Wiring

Refer to the Hook-up Diagram included in this manual.

Keybus Wires

Connect the red, black, yellow and green wires to the RED, BLK, YEL and GRN terminals on the control panel, respectively. Refer to your panel's Installation Manual for complete instructions on Keybus wiring.

Zone Input terminals

The zone inputs Z10 to Z14 as well as A and B will report as PC5010 zones 10-16. This is not optional. These zones cannot be programmed to enunciate as any other system zones.

The PC5720 zone inputs are as follows:

- The EGND input will report as control panel zone 09. It is a ground fault detection zone only. When the PC5720 detects an incorrect ground connection, a zone 9 trouble is sent to the control panel. Zone 09 must be programmed as a 24-hour supervisory zone (zone type 09). A ground fault cannot cause a false alarm on any zone, nor can it inhibit any zone's performance.
- Zone inputs Z10-Z14 will report as control panel zones 10-14.
- Zones 15 and 16 are normally open Class A loops. These correspond to two sets of A and B terminals on the PC5720. Zones 15 and 16 must be programmed as Delay Fire (zone type 07) or Standard Fire (zone type 08). These zones must be connected according to the following diagram:

Normally Open Class A Loops

The two Normally Open Class A Loops (Zones 15 and 16) function as follows:

- **Restored States**

A1+ is shorted to A1-.

B1+ is shorted to B1-.

There is a Normally-Open contact between A1 and B1.

A2+ is shorted to A2-.

B2+ is shorted to B2-.

There is a Normally-Open contact between A2 and B2.

- **Alarms**

If the Normally-Open contact between A1 and B1 is shorted a Z15 Alarm will result.

If the Normally-Open contact between A2 and B2 is shorted a Z16 Alarm will result.

Note: A short from either A1+ or A1- to either B1+ or B1- will cause an alarm to occur. This is also true to A2 and B2.

- **Troubles**

If either of the shorts on A1 (+ to -) or B1 (+ to -) is removed, a Z15 Trouble will result.

If either of the shorts on A2 (+ to -) or B2 (+ to -) is removed, a Z16 Trouble will result.

Tamper

There is no tamper input for the PC5720.

Module Supervision

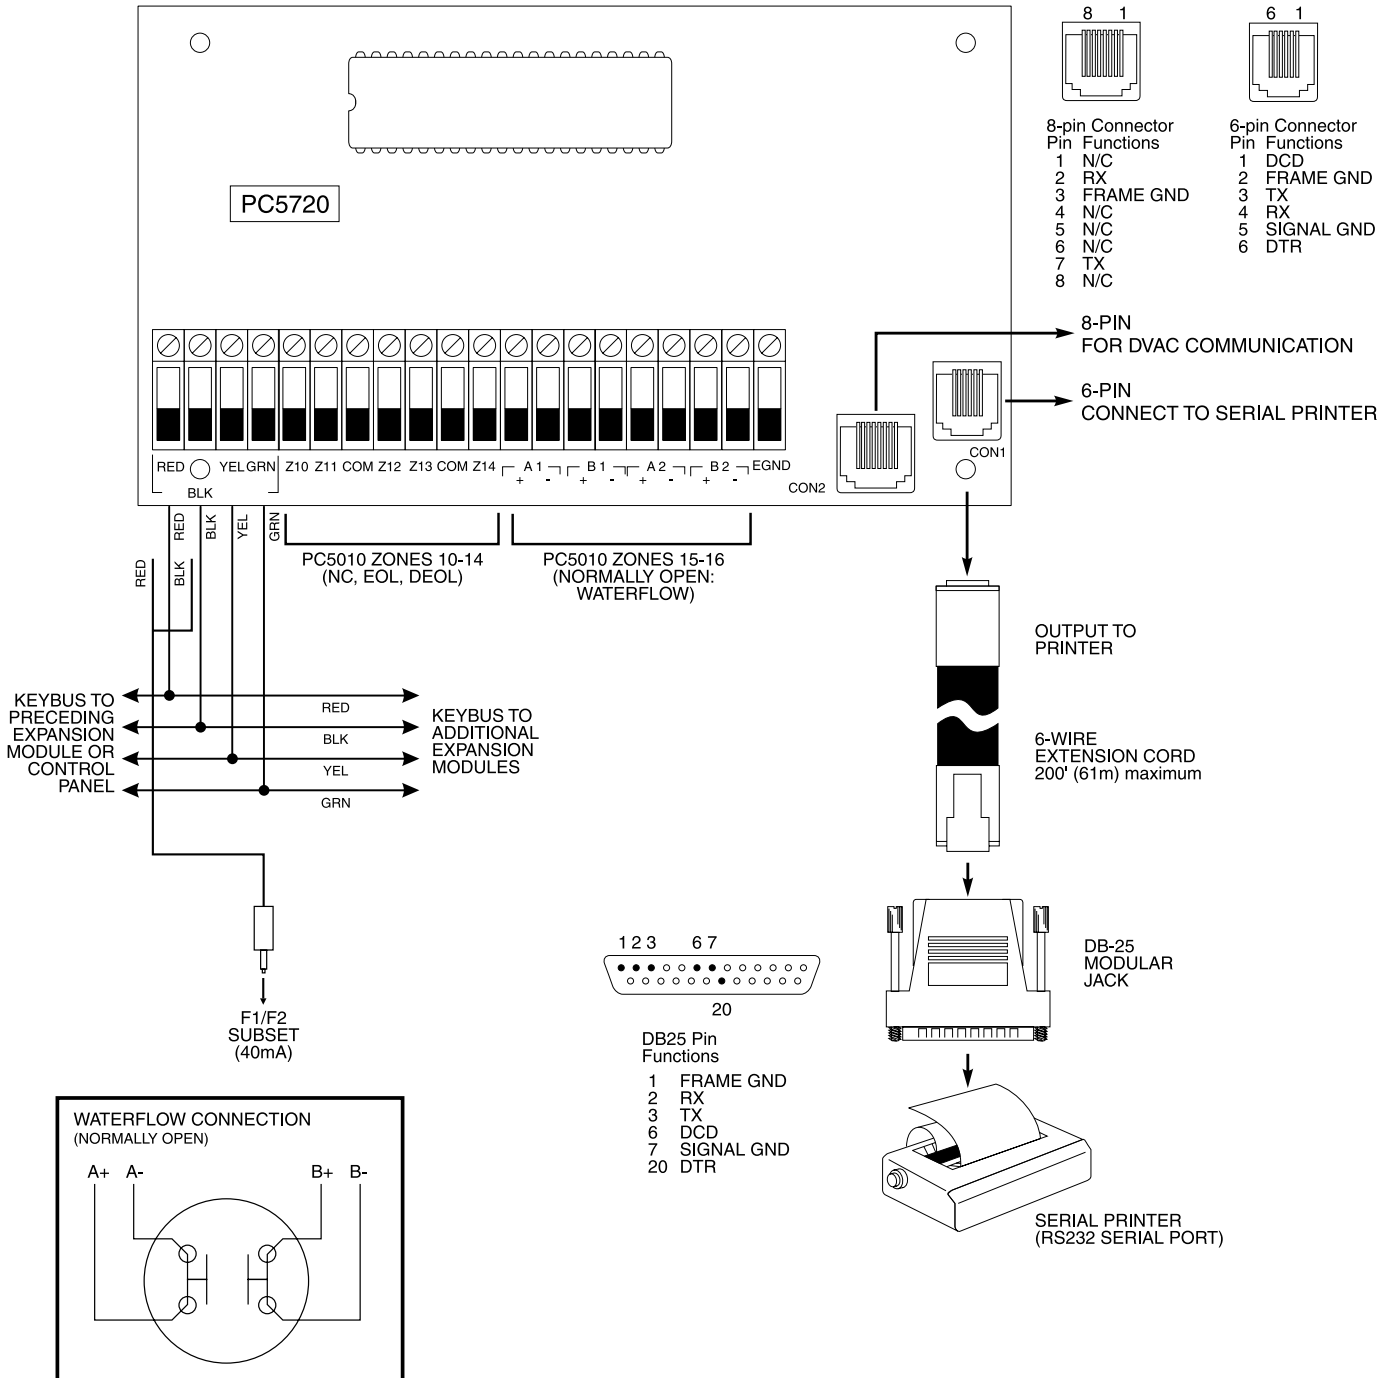

The PC5720 will not be supervised as a single unit unlike the other Power832 modules. It will be supervised as a PC5400 (printer) or alternate communicator (DVAC) and zone expanders 1 and 2 (zones 9-12, zones 13-16). These three areas of supervision correspond to supervision zone lights [20] (printer) or [22] (alternate communicator), [9] and [10] when all modules are displayed by entering [★] [8] [Installer's Code] [903]. The supervision restorals of all modules will be transmitted through the DVAC line (if used).

In order for the PC5720 to be supervised, you must follow the supervision procedure. For details, please refer to your panel's Installation Manual.

If the PC5720 loses communication with the main panel, a Keybus fault will be transmitted through the DVAC line. The PC5720 (the alternator communicator and zone expanders 1 and 2) will go into supervisory fault. All events which occur during the Keybus fault will not be transmitted through the DVAC line. Once communications have been restored, a Keybus fault restoral will be transmitted and the PC5720 (alternate communicator and zone expanders 1 and 2) will be restored from supervisory fault.

If the PC5720 loses communications with the DVAC receiver, it will stop supervising the alternate communicator, causing an alternate communicator supervisory fault. When communications are restored, an alternate communicator supervisory fault restoral will be sent.

PC5720 Wiring Diagram

Programming Sections

S E C T I O N 3

Program the PC5720 in module programming section [801] in installer's programming mode. For instructions on installer's programming, refer to your control panel's Installation Manual, section four "How to Program".

If you will be connecting the PC5720 to a serial printer, program sections [01] to [05]. If you will be using DVACS, program section [06], option [1] as OFF. Once the PC5720 has been changed to a DVAC module, you must access DVAC programming in module programming section [803], and complete programming in sections [10] to [94].

Serial Printer Programming:

Section [01], Option [1] Printer Enable/Disable

Enables the module for use with a serial printer.

Section [01], Option [2] Handshake Enable/Disable

Enables a handshake with the printer.

Section [01], Option [3] Printer Columns

Program the number of columns appropriate for the printer.

Section [01], Options [4] to [7] Baud Rate

Program the baud rate the PC5720 module will use to communicate with the serial printer. The baud rate is the speed at which information will be transmitted from the PC5720 module to the serial printer. There are four different baud rates available. If you are experiencing problems with missing characters, try lowering the baud rate.

Section [01], Option [8] Clock display

Program how the clock displays the time.

Section [05] Printer Language Selection

The default language is English. You can program the module for French, Spanish or Swedish.

NOTE: If some characters do not print correctly, try changing the character set your printer uses.

PC5400 Miscellaneous Options – Section [06], Option [1]

Program this options as ON if you will be using a serial printer, or as OFF if you will be using DVACS.

NOTE: If you change this option, the PC5720 will return to its factory default programming.

Sections [10-13] Wireless & Miscellaneous Reporting Codes

Program the DVACS reporting codes in these sections (see DVACS Transmission Table for Transmission Codes):

- To have the PC5720 transmit a pre-programmed code from the internal table, leave the programming at the default value FF. Default reporting codes are listed in the Appendix B.
- To prevent the PC5720 from reporting an event, program the code as 00.
- To have the PC5720 transmit a different code, program a value from 01-FE.

Sections [20-23] Wireless & Miscellaneous Reporting Types

By programming the Reporting Types sections, you can add additional information to each transmission.

For example, you can program the reporting *code* for zone 1 as 01 and the reporting *type* for zone 1 as 00, to indicate that zone 1 is a fire zone. Refer to the DVACS Reporting Type tables on pages 24-27.

- To have the PC5720 transmit a pre-programmed code from the internal table, leave the programming at the default value FF. Default reporting types are listed in the Appendix A.
- To have the PC5720 transmit a different code, program a value from 00-7F.

NOTE: Do not program values above 7F.

Sections [36-39] Zone Definitions

Make sure that the zone definitions match those programmed in the control panel.

Section [40] DVACS ID Code

Program the DVACS ID code in this section. This code identifies a PC5720 module on a DVACS subset, specifying which poll from a F2 node the module will respond to. Valid entries are 01 - F0.

Section [41] All Call Select

Use this section to program which all call response the PC5720 will have. The options are:

- (00) no response on any all call
- (01) response on all call #1 only
- (02) response on all call #2 only
- (03) response on both all calls
- (04) modules with odd-numbered ID codes (see section 40) respond to All Call #1. Modules with even-numbered ID codes respond to All Call #2. (E.g. a module with ID code 03 will respond to All Call #1. A module with ID code 04 will respond to All Call #2.)

Section [42] Miscellaneous (Transmission) Options

Option 1: Turn this option ON to have the PC5720 send alarms during an all call. Turn this option OFF to have the PC5720 send alarms and restorals during an all call.

Option 2: Turn this option ON to have the PC5720 report which zones have been bypassed. Turn this option OFF for prevent the PC5720 from reporting which zones have been bypassed.

Option 3: Turn this option ON to have the PC5720 report openings and closings. Turn this option OFF to to prevent the PC5720 from reporting openings and closings.

Sections [43-68] Reporting Codes

Program the DVACS reporting codes in these sections (see DVACS Transmission Table for Transmission Codes):

- To have the PC5720 transmit a pre-programmed code from the internal table, leave the programming at the default value FF. Default reporting codes are listed in the Appendices B.
- To prevent the PC5720 from reporting an event, program the code as 00.
- To have the PC5720 transmit a different code, program a value from 01-FE.

Sections [69-94] Reporting Types

By programming the Reporting Types sections, you can add additional information to each transmission.

For example, you can program the reporting *code* for zone 1 as 01 and the reporting *type* for zone 1 as 00, to indicate that zone 1 is a fire zone. Refer to the DVACS Reporting Type tables on pages 24-27.

- To have the PC5720 transmit a pre-programmed code from the internal table, leave the programming at the default value FF. Default reporting types are listed in the Appendix A.
- To have the PC5720 transmit a different code, program a value from 00-7F.

NOTE: Do not program values above 7F.

NOTE: If you change any of the above options from the default settings, test the PC5720 to make sure it is operating as desired.

WARNING Please Read Carefully

Note to Installers

This warning contains vital information. As the only individual in contact with system users, it is your responsibility to bring each item in this warning to the attention of the users of this system.

System Failures

This system has been carefully designed to be as effective as possible. There are circumstances, however, involving fire, burglary, or other types of emergencies where it may not provide protection. Any alarm system of any type may be compromised deliberately or may fail to operate as expected for a variety of reasons. Some but not all of these reasons may be:

■ **Inadequate Installation**

A security system must be installed properly in order to provide adequate protection. Every installation should be evaluated by a security professional to ensure that all access points and areas are covered. Locks and latches on windows and doors must be secure and operate as intended. Windows, doors, walls, ceilings and other building materials must be of sufficient strength and construction to provide the level of protection expected. A reevaluation must be done during and after any construction activity. An evaluation by the fire and/or police department is highly recommended if this service is available.

■ **Criminal Knowledge**

This system contains security features which were known to be effective at the time of manufacture. It is possible for persons with criminal intent to develop techniques which reduce the effectiveness of these features. It is important that a security system be reviewed periodically to ensure that its features remain effective and that it be updated or replaced if it is found that it does not provide the protection expected.

■ **Access by Intruders**

Intruders may enter through an unprotected access point, circumvent a sensing device, evade detection by moving through an area of insufficient coverage, disconnect a warning device, or interfere with or prevent the proper operation of the system.

■ **Power Failure**

Control units, intrusion detectors, smoke detectors and many other security devices require an adequate power supply for proper operation. If a device operates from batteries, it is possible for the batteries to fail. Even if the batteries have not failed, they must be charged, in good condition and installed correctly. If a device operates only by AC power, any interruption, however brief, will render that device inoperative while it does not have power. Power interruptions of any length are often accompanied by voltage fluctuations which may damage electronic equipment such as a security system. After a power interruption has occurred, immediately conduct a complete system test to ensure that the system operates as intended.

■ **Failure of Replaceable Batteries**

This system's wireless transmitters have been designed to provide several years of battery life under normal conditions. The expected battery life is a function of the device environment, usage and type. Ambient conditions such as high humidity, high or low temperatures, or large temperature fluctuations may reduce the expected battery life. While each transmitting device has a low battery monitor which identifies when the batteries need to be replaced, this monitor may fail to operate as expected. Regular testing and maintenance will keep the system in good operating condition.

■ **Compromise of Radio Frequency (Wireless) Devices**

Signals may not reach the receiver under all circumstances which could include metal objects placed on or near the radio path or deliberate jamming or other inadvertent radio signal interference.

■ **System Users**

A user may not be able to operate a panic or emergency switch possibly due to permanent or temporary physical disability, inability to reach the device in time, or unfamiliarity with the correct operation. It is important that all system users be trained in the correct operation of the alarm system and that they know how to respond when the system indicates an alarm.

■ **Smoke Detectors**

Smoke detectors that are a part of this system may not properly alert occupants of a fire for a number of reasons, some of which follow. The smoke detectors may have been improperly installed or positioned. Smoke may not be able to reach the smoke detectors, such as when the fire is in a chimney, walls or roofs, or on the other side of closed doors. Smoke detectors may not detect smoke from fires on another level of the residence or building.

Every fire is different in the amount of smoke produced and the rate of burning. Smoke detectors cannot sense all types of fires equally well. Smoke detectors may not provide timely warning of fires caused by carelessness or safety hazards such as smoking in bed, violent explosions, escaping gas, improper storage of flammable materials, overloaded electrical circuits, children playing with matches or arson.

Even if the smoke detector operates as intended, there may be circumstances when there is insufficient warning to allow all occupants to escape in time to avoid injury or death.

■ **Motion Detectors**

Motion detectors can only detect motion within the designated areas as shown in their respective installation instructions. They cannot discriminate between intruders and intended occupants. Motion detectors do not provide volumetric area protection. They have multiple beams of detection and motion can only be detected in unobstructed areas covered by these beams. They cannot detect motion which occurs behind walls, ceilings, floor, closed doors, glass partitions, glass doors or windows. Any type of tampering whether intentional or unintentional such as masking, painting, or spraying of any material on the lenses, mirrors, windows or any other part of the detection system will impair its proper operation.

Passive infrared motion detectors operate by sensing changes in temperature. However their effectiveness can be reduced when the ambient temperature rises near or above body temperature or if there are intentional or unintentional sources of heat in or near the detection area. Some of these heat sources could be heaters, radiators, stoves, barbecues, fireplaces, sunlight, steam vents, lighting and so on.

■ **Warning Devices**

Warning devices such as sirens, bells, horns, or strobes may not warn people or waken someone sleeping if there is an intervening wall or door. If warning devices are located on a different level of the residence or premise, then it is less likely that the occupants will be alerted or awakened. Audible warning devices may be interfered with by other noise sources such as stereos, radios, televisions, air conditioners or other appliances, or passing traffic. Audible warning devices, however loud, may not be heard by a hearing-impaired person.

■ **Telephone Lines**

If telephone lines are used to transmit alarms, they may be out of service or busy for certain periods of time. Also an intruder may cut the telephone line or defeat its operation by more sophisticated means which may be difficult to detect.

■ **Insufficient Time**

There may be circumstances when the system will operate as intended, yet the occupants will not be protected from the emergency due to their inability to respond to the warnings in a timely manner. If the system is monitored, the response may not occur in time to protect the occupants or their belongings.

■ **Component Failure**

Although every effort has been made to make this system as reliable as possible, the system may fail to function as intended due to the failure of a component.

■ **Inadequate Testing**

Most problems that would prevent an alarm system from operating as intended can be found by regular testing and maintenance. The complete system should be tested weekly and immediately after a break-in, an attempted break-in, a fire, a storm, an earthquake, an accident, or any kind of construction activity inside or outside the premises. The testing should include all sensing devices, keypads, consoles, alarm indicating devices and any other operational devices that are part of the system.

■ **Security and Insurance**

Regardless of its capabilities, an alarm system is not a substitute for property or life insurance. An alarm system also is not a substitute for property owners, renters, or other occupants to act prudently to prevent or minimize the harmful effects of an emergency situation.

LIMITED WARRANTY

Digital Security Controls Ltd. warrants the original purchaser that for a period of twelve months from the date of purchase, the product shall be free of defects in materials and workmanship under normal use. During the warranty period, Digital Security Controls Ltd. shall, at its option, repair or replace any defective product upon return of the product to its factory, at no charge for labour and materials. Any replacement and/or repaired parts are warranted for the remainder of the original warranty or ninety (90) days, whichever is longer. The original owner must promptly notify Digital Security Controls Ltd. in writing that there is defect in material or workmanship, such written notice to be received in all events prior to expiration of the warranty period.

International Warranty

The warranty for international customers is the same as for any customer within Canada and the United States, with the exception that Digital Security Controls Ltd. shall not be responsible for any customs fees, taxes, or VAT that may be due.

Warranty Procedure

To obtain service under this warranty, please return the item(s) in question to the point of purchase. All authorized distributors and dealers have a warranty program. Anyone returning goods to Digital Security Controls Ltd. must first obtain an authorization number. Digital Security Controls Ltd. will not accept any shipment whatsoever for which prior authorization has not been obtained.

Conditions to Void Warranty

This warranty applies only to defects in parts and workmanship relating to normal use. It does not cover:

- damage incurred in shipping or handling;
- damage caused by disaster such as fire, flood, wind, earthquake or lightning;
- damage due to causes beyond the control of Digital Security Controls Ltd. such as excessive voltage, mechanical shock or water damage;
- damage caused by unauthorized attachment, alterations, modifications or foreign objects;
- damage caused by peripherals (unless such peripherals were supplied by Digital Security Controls Ltd.);
- defects caused by failure to provide a suitable installation environment for the products;
- damage caused by use of the products for purposes other than those for which it was designed;
- damage from improper maintenance;
- damage arising out of any other abuse, mishandling or improper application of the products.

Digital Security Controls Ltd.'s liability for failure to repair the product under this warranty after a reasonable number of attempts will be limited to a replacement of the product, as the exclusive remedy for breach of warranty. Under no circumstances shall Digital Security Controls Ltd. be liable for any special, incidental, or consequential damages based upon breach of warranty, breach of contract, negligence, strict liability, or any other legal theory. Such damages include, but are not limited to, loss of profits, loss of the product or any associated equipment, cost of capital, cost of substitute or replacement equipment, facilities or services, down time, purchaser's time, the claims of third parties, including customers, and injury to property.

Disclaimer of Warranties

This warranty contains the entire warranty and shall be in lieu of any and all other warranties, whether expressed or implied (including all implied warranties of merchantability or fitness for a particular purpose) And of all other obligations or liabilities on the part of Digital Security Controls Ltd. Digital Security Controls Ltd. neither assumes nor authorizes any other person purporting to act on its behalf to modify or to change this warranty, nor to assume for it any other warranty or liability concerning this product.

This disclaimer of warranties and limited warranty are governed by the laws of the province of Ontario, Canada.

WARNING: Digital Security Controls Ltd. recommends that the entire system be completely tested on a regular basis. However, despite frequent testing, and due to, but not limited to, criminal tampering or electrical disruption, it is possible for this product to fail to perform as expected.

Installer's Lockout

Any products returned to DSC which have the Installer's Lockout option enabled and exhibit no other problems will be subject to a service charge.

Out of Warranty Repairs

Digital Security Controls Ltd. will at its option repair or replace out-of-warranty products which are returned to its factory according to the following conditions. Anyone returning goods to Digital Security Controls Ltd. must first obtain an authorization number. Digital Security Controls Ltd. will not accept any shipment whatsoever for which prior authorization has not been obtained.

Products which Digital Security Controls Ltd. determines to be repairable will be repaired and returned. A set fee which Digital Security Controls Ltd. has predetermined and which may be revised from time to time, will be charged for each unit repaired.

Products which Digital Security Controls Ltd. determines not to be repairable will be replaced by the nearest equivalent product available at that time. The current market price of the replacement product will be charged for each replacement unit.
