MESSAGE TO THE INSTALLER

The PowerMaxComplete control panel is supplied with 2 instruction manuals:

- **Installer Guide** (this manual - for your exclusive use)
- **User’s Guide** (for your use during installation only - Must be handed over to the master user after testing the system).

Appendices A.1 and A.2 will help you prepare an installation plan. Please take time to fill out the forms - your job will become much easier and confusion will be prevented. Filling out the forms will also help you create a list of detectors and transmitters that must be obtained for the particular application. Compatible detectors and transmitters are listed and described briefly in Appendix E.

Remember - it is advisable to power up the control panel temporarily after unpacking and program it on the work bench, in accordance with the installation plan.

The programming flow charts in the programming section show all options available for each parameter. Factory defaults are marked with a dark box to their right, and other options (that can be selected instead) are marked by clear boxes. This method allows you to put a checkmark in the appropriate clear box whenever you deviate from the factory defaults.

Most of the programming section paragraph numbers correlate with the programming menu numbers. For example, paragraph 4.4.19 describes the "Jam detect", that exists in menu 4 (define panel), sub-menu 19 (Jam detect).

Although setting the correct time and date is one of the user tasks, we recommend that you set the time and date in the course of programming. Access to the “User Settings” for the installer is possible through item 10 on the installer’s menu or through the user menu (see User’s manual section 7).

After programming, proceed to install the system as detailed in the Installation Instructions, from paragraph 3.4 onward.

The installer should verify line seizure. Be aware of other phone line services such as DSL. If DSL service is present on the phone line, you must install a filter. It is suggested to use the DSL alarm filter model Z-A431PJ31X manufactured by Excelsus Technologies, or equivalent. This filter simply plugs into the RJ-31X jack and allows alarm reporting without breaking the internet connection.
1. INTRODUCTION

The PowerMaxComplete is a user and installer-friendly, 30-zone fully-supervised wireless control system. The system is designed to function in an appealing way to the user and also offers features that make installers' life easier than ever before:

EASY TO INSTALL
- Optional plug-in RS-232 module that enables connection of an external GSM Module or local computer.

EASY TO MAINTAIN
- Status, alarm memory and trouble data are displayed upon request.

- Diagnostic test provides visual and audible indication of the signal level of each detector.
- Remote control and status verification from distant telephones.
- Event log stores and displays information.
- Upload / download from distant computer via telephone line or cellular modem.

QUICK PROGRAMMING
- Simple programming logic, fully menu driven.
- Multiple-choice selection of options for each parameter.
- Unequivocal visual prompts and audible signals.
- Installer access to the user menu.

2. SPECIFICATIONS

2.1 General Data

Zones Number: 28 wireless, 2 hardwired (zones 29 & 30).

Hardwired Zone Requirements: 2.2 kΩ E.O.L. resistance (max. resistance of wires 220 Ω).

Zone Types: Interior follower, interior, perimeter, perimeter follower, delay 1, delay 2, 24h silent, 24h audible, fire, non-alarm, emergency, gas and flood.

User Codes: 8 codes, 4 digits each (9999 different combinations). Code 0000 is not allowed.

Control Facilities:
- Integral keypad
- PowerCode / Code-Secure™ hand-held transmitters
- Wireless commander
- Remote telephone
- Local or remote computer

Display: Single line, Backlit 16-character LCD.

Arming Modes: AWAY, HOME, AWAY-INSTANT, HOME-INSTANT, LATCHKEY, FORCED, BYPASS.

Alarm inhibited during a single arming period (swinger stop) after: 1, 2, 3, alarm/tamper/fault, or not inhibited (programmable / selectable).

Alarm Types: Silent alarm, siren alarm or sounder (internal) alarm, in accordance with zone attributes.

Siren (bell) Timeout: Programmable (4 min. by default)

Internal Sounder Output: At least 85 dBA at 10 ft (3 m)

Supervision: Programmable time frame for inactivity alert

Special Functions:
- Speech and sound control
- Chime zones
- Diagnostic test and event log
- Remote control by telephone
- Computer control and data download/upload
- Calling for help by using an emergency transmitter
- Tracking inactivity of elderly, physically handicapped and infirm people
- Family message center (recording and playback)
- Two-way voice communication

Data Retrieval: Status, alarm memory, trouble, event log.

Real Time Clock (RTC): The control panel keeps and displays time and date.

Compliance with U.S. Standards:
Meets FCC 47 Part 15 and Part 68 requirements.

Compliance with European CE Standards:
EN 50082-1, EN301489-3, 7, EN6100-4-6, EN60950, EN300220, EN50130-4, EN50130-5, EN50131-3

According to the European standard EN50131-1, the PowerMaxComplete security grading is 2 – “low to medium risk” and environmental classification is II – “indoor general” and the power supply type is A.

GSM standards:
Europe: Complies with CE standards 3GPP TS 51.010-1, EN 301 511, EN 50361, EN301489-7
USA: FCC 47 Part 22 (GSM850) and Part 24 (GSM 1900), UL1637, UL1635, UL1023, UL985, UL-S545-02, ULC C1023.

2.2 RF Section

Operating Frequencies (MHz): 315 (in USA & Canada), 433, 868.95 or other UHF channel per local requirement in the country of use.

Receiver Range: 600 ft (180 m) in open space

Antenna Type: Super-heterodyne, fixed frequency

Coding: PowerCode and/or CodeSecure™

2.3 Electrical Data

Power Supply: Internal switching power supply 100VAC to 240VAC, 50/60 Hz, 0.5A / 12.5 VDC, 1.6A.

Current Drain: Approx. 40 mA standby, 1400 mA at full load.

Site External Siren Current (EXT): 450* mA max @ 10.5 VDC minimum when powered by AC & DC (battery).

Site Internal Siren Current (INT): 450* mA max. @ 10.5 VDC minimum when powered by AC & DC (battery)

PGM Output Current: 100* mA max.

Wired Detectors (zones 29/30) Total (Sum) Current: 36* mA max.

High Current / Short Circuit Protection: All outputs are protected (automatic reset fuse). * Total PowerMaxComplete output current (of INT & EXT sirens, PGM output and detectors) cannot exceed 550 mA.
### 2.4 Communication

**Built-in Modem:** 300 baud, Bell 103 protocol  
**Data Transfer to Local Computer:** Via RS232 serial port  
**Report Destinations:** 2 central stations, 4 private telephones, 1 pager.  
**Reporting Format Options:** SIA, Pulse 4/2 1900/1400 Hz, Pulse 4/2 1800/2300 Hz, Contact ID, Scancom.  
**Pulse Rate:** 10, 20, 33 and 40pps - programmable  
**Message to Private Phones:** Tone or voice  
**Message to Pager:** PIN No ➔ Alarm Type ➔ Zone No.  
**Ring Detection:** The unit does not support ring detection without DC voltage present on the telephone lines.

### 2.5 Physical Properties

**Operating Temp. Range:** 14°F to 120°F (-10°C to 49°C)  
**Storage Temp. Range:** -4°F to 140°F (-20°C to 60°C)  
**Humidity:** 85% relative humidity, @ 30°C (86°F)  
**Size:** 266 x 206 x 63 mm (10-7/16 x 8-18 x 2-1/2 in.)  
**Weight:** 1.44Kg (3.2 pounds) (with battery)  
**Color:** White

### 3. INSTALLATION

#### 3.1 Unpacking the Equipment

Open the cardboard packing box and check whether all items have been included. If you find out that an item is missing, contact your vendor or dealer immediately.

#### 3.2 Supplying Power to the Unit

Connect power to the PowerMaxComplete temporarily (see figure 3.10). Alternatively, you may power up from the backup battery, as shown in figure 3.3.  
Disregard any “trouble” indications pertaining to lack of battery or lack of telephone line connection.

#### 3.3 System Planning & Programming

It pays to plan ahead - use the tables in appendices A and B at the end of this guide to register the intended location of each detector, the holder and assignment of each transmitter. Gather up all transmitters and detectors used in the system and mark each one in accordance with your deployment plan.  
Program the system now as instructed in the programming section.

#### 3.4 Mounting

Required tool: Philips screwdriver #2.  
PowerMaxComplete mounting process is shown in figure 3.1 - 3.11.

#### 3.5 Wiring

Required tools: Cutter and slotted screwdriver - 3 mm blade.  
PowerMaxComplete wiring is shown in figure 3.2.
1. Release screws
2. Mark 4 drilling points on mounting surface
3. Drill 4 holes and insert wall anchors
4. Fasten the back unit with 4 screws

**Figure 3.1 – Back Unit Mounting**

---

**PHONE WIRING**

Connect telephone cable to SET connector and telephone line cable to LINE connector (through the desired wiring cable entry).

---

**PHONE WIRING IN NORTH AMERICA**

ZONE 29 & SIREN WIRING

OPTIONAL EXPANDER MODULE
ZONES, SIRENS, AUDIO BOX AND WIRED DETECTORS WIRING

Notes for EXPANDER module wiring:

* Zone 29/GND and Zone 30/GND terminals can be connected to a normally closed contact of a detector, switch (for example a Tamper switch of any device), or a pushbutton, via a 2.2 KΩ resistor. The 12V terminal can be used to supply 12V (up to 36mA) to a detector (if necessary).

** The EXT terminal can be used to trigger an external siren. The INT terminal can be programmed for an "internal siren" or "strobe" (see DEFINE OUTPUTS - DEFINE INT/STRB in par. 4.8).

The 12V and "GND" terminals can be connected to a siren (for constant DC power supply).

WARNING! When plugging terminals back into place, be sure to align them carefully with the pins on the PCB. Misaligned or reverse insertion of terminals may damage internal PowerMaxComplete circuits!

IMPORTANT! The terminals for internal and external sirens are DC outputs intended for 12V sirens. Connecting a loudspeaker to any of these outputs will cause a short circuit and will damage the unit.
Notes for UL installations

a. The sirens connected to the sites INTERNAL or EXTERNAL SIREN in the EXPANDER must be suitable for burglar alarm applications. If UL fire installation is required, all installed accessories must comply with UL fire standards. Any external siren used, must be UL listed and shall be rated to operate under the voltage specified in the Specifications. 

Note: The siren on the control panel PCB is non-UL compliant.

b. A device that is connected to PGM terminal should not exceed the current consumption defined for the 24-hour backup period listed in the Backup Battery Options table (see section 2.3).

c. The system shall be installed in accordance with Chapter 2 of the National Fire Alarm Code, ANSI/NFPA 70.

d. All wiring should be acceptable for class 1 systems as defined by the National Electrical Code, ANSI/NFPA 70. No. 26 AWG or larger telecommunication line cord shall be used.

e. The system shall be installed in accordance with CSA C22.1 Canadian Electrical Code, Part 1.

f. A minimum spacing of 1/4 inch shall be maintained between the telephone wiring and the low voltage wiring (zones, bell circuit, etc). Do not route the LINE and SET wires in the same wiring channel with other wires.

3.6 Backup Battery Insertion

Open battery compartment cover (see drawing below). Insert one 6-battery pack or 8-battery pack and connect its connector as shown below.

![Figure 3.3 - Battery Insertion](image)

3.7 Optional GSM Module Mounting

Note: The GSM module can be used with an internal or external antenna.

Plug in the GSM Module and fasten it with the screw:

![Figure 3.4 - Optional GSM Module Mounting](image)

Insert the SIM card into the GSM module:

![Figure 3.5 - SIM Card insertion](image)

For internal antenna only: Remove the paper strip from the antenna sticker and stick the antenna on the control panel. Connect the antenna to the control panel GSM antenna connector
3.6 GSM Internal Antenna Mounting

For external antenna only: Connect the external antenna to the GSM antenna connector. Verify that the antenna cable routing enables proper closing of the control panel.

Figure 3.6 - GSM Internal Antenna Mounting

3.7 GSM External Antenna Connection

Figure 3.7 - GSM External Antenna Connection

3.8 DUAL RS-232 Optional Module Mounting

The DUAL RS-232 is a Module that enables connection of any two simultaneous devices, such as Local PC or external GSM Module.

The external GSM unit enables the PowerMaxComplete system to operate over a cellular network (for details regarding the GSM modem features and connections, refer to the external GSM Modem installation instructions).

To install the DUAL RS-232 module into the control panel, press it into the marked location (see drawing below) until a click is heard.

Connect a local PC or external GSM module, to one of the DUAL RS-232 module connectors, as shown below.

Figure 3.8 – DUAL RS-232 Module Mounting

3.9 Optional Expander Module Mounting

The EXPANDER module enables connection of speech box, site external siren, site internal siren or strobe and connection of wired detector to zone number 29 and 30.

The EXPANDER module also enables connection of a desired device to PGM (programmable) output that is activated according to a predefined conditions.

Mount the Expander module as shown below.

Figure 3.9 – EXPANDER Module Mounting

3.10 Power Cable Connection

Connect the power cable and close the control panel as shown in figure 3.10.

Socket-outlet shall be installed near the equipment and shall be easily accessible.
Connect the power supply output cable to the power connector in the front panel.

Insert power cable through the desired wiring channel (see step 1), route it to the power supply unit and connect its 2 wires to the power supply terminal strip with screwdriver. Fasten power cable by its clamp (see also step 2 - this clamp can be reversed to fit thick/thin cable) and close the safety cover.

Connect the power adapter to the front panel power connector.

* Do not route wiring in this area, to enable proper closure of the control panel.
3.11 Control Panel Final Closure

Control panel final closure is shown below.

1. Connect the flat cables, between front and back units, in their respective connectors (up to 3, according to options).

2. Close the panel and fasten the 2 screws.

Figure 3.11 - Final Closure
4. PROGRAMMING

4.1 INTRODUCTION

4.1.1 General Guidance

We recommend to program the PowerMaxComplete on the work bench before actual installation. Operating power may be obtained from the backup battery or from the AC power supply. The installer's menu is accessible only to those who know the installer's 4-digit code, which is 9999 by factory default. Note: Access to the installer menu, in PowerMaxComplete that has "User Permission" enabled (for example in UK) is accessible only at the end of the user menu. This option can be changed is necessary (see par. 4.4.36).

For PowerMaxComplete that has 2 installer codes (not applicable in UK), the default INSTALLER code is 8888 and the default MASTER INSTALLER code is 9999. The following actions can be done only by using the master installer code:

- Changing master installer code.
- Resetting the PowerMaxComplete parameters to the default parameters,
- Defining specific communication parameters, as detailed in a note in figure 4.5.

Obviously, you are expected to use this code only once for gaining initial access, and replace it with a secret code known only to yourself.

You will mainly use 5 control pushbuttons during the entire programming process:

- to move one step forward in a menu.
- to move one step backward in a menu.
- to enter the relevant menu or confirm data.
- to move one level up in a menu.
- to return to the "OK TO EXIT" state.

The sounds you will hear while programming are:

- Single beep, heard whenever a key is pressed.
- Double beep, indicates automatic return to the normal operating mode (by timeout).
- Happy Melody (----), indicates successful completion of an operation.
- Sad Melody (-----), indicates a wrong move or rejection.

4.1.2 Entering an Invalid Installer Code

If you enter an invalid installer code 5 times, the keypad will be automatically disabled for 90 seconds and the message WRONG PASSWORD will be displayed.

4.1.3 Installer's Menu

The installer's menu is shown in figure 4.1a. The text in rectangles represents the current PowerMaxComplete display.

4.1.4 Setting a New Installer Code

To set an installer code, perform the actions that are presented in figure 4.1b. When you are instructed to enter code, enter a 4-digit code.

4.1.5 Setting a New Installer Code in PowerMaxComplete that has 2 Installer Codes

For PowerMaxComplete with 2 installer codes, INSTALLER code (default 8888) and MASTER INSTALLER code (default 9999), set new codes as shown in figure 4.1c.

For details regarding the different authorization levels when logging in with installer code and master installer code, refer to the note inside figure 4.5 (DEFINE COMM).

By using the master installer code, the menu enables changing both master installer code and installer code. By using the installer code, the menu enables changing the installer code only.

Figure 4.1a - Installer's Menu
4.2 ENROLLING WIRELESS DEVICES AND KEYFOB TRANSMITTERS

4.2.1 General Guidance
The ENROLLING mode has the following sub-modes:
- ENROLL TYPE (wireless devices)
- ENROLL SENSORS
  - ENROLL KEYFOB (multi-button CodeSecure transmitters)
  - ENROLL WL 1WAY KP (wireless commander MCM-140+)
  - ENROLL WL 2WAY KP (wireless 2-way keypad MKP-150/MKP-151)
  - ENROLL WL SIREN (wireless siren)
  - ENROLL PROX TAG (proximity tag)
- ENROLL WL 1WAY KP (wireless commander MCM-140+)
- ENROLL WL 2WAY KP (wireless 2-way keypad MKP-150/MKP-151)
- ENROLL WL SIREN (wireless siren)
- ENROLL PROX TAG (proximity tag)
- Before beginning, gather all the devices that you intend to enroll and make sure they all have batteries installed.
- Your control panel must recognize the unique identification code (ID) of each such device in order to supervise them, receive their signals and respond accordingly.

Attention! CodeSecure transmitters are mainly used for arming/disarming and can not be enrolled to zones. In order to enroll to zones, use only non-CodeSecure wireless devices.

4.2.2 Enrolling Type
Here you determine whether to enroll a wireless device by normal transmission or by device Tamper function (opening its cover). Options: normal, or by tamper.

4.2.3 Enroll/Delete Sensors
For PowerMaxComplete without expander module:
- Magnetic contact or any other contact (not a detector) can be enrolled in zone 29.
- Wired detectors can be enrolled in zones 29–30 and wireless detectors can be enrolled in zones 01–28.

STOP
- Before enrolling, the lens at the front of PIR and dual-technology sensors should be masked to prevent inadvertent transmission.
- Make sure that magnetic contact transmitters are together with their magnets, to prevent them from sending alarm transmissions.

To enroll / delete wired / wireless sensors, refer to Fig. 4.2.

4.2.4 Enroll/Delete Keyfob Transmitters
Keyfob transmitters are multi-button wireless CodeSecure™ transmitters. Eight system users use them for better, quicker and safer control over various system functions.

4.2.5 Enroll/Delete Wireless Commander
The Wireless Commander (MCM-140+) is a remote control unit that enables the user to remotely control the system. To enroll / delete up to 8 wireless commanders, refer to figure 4.2 (Enroll WL 1-way KP).

4.2.6 Enroll/Delete 2-Way Keypad
The 2-way keypad, type MKP-150/MKP-151, enables the user to remotely control the system and also to receive data from the system (status, alarm and trouble data). To enroll up to two 2-way keypads, refer to figure 4.2.

4.2.7 Enroll/Delete Wireless Siren
The wireless siren is a remote siren that is activated upon predefined events by the PowerMaxComplete system. To enroll / delete up to 2 wireless sirens, refer to figure 4.2.

4.2.8 Enroll/Delete Proximity Tags
Proximity tags enable authorized people to enter restricted areas. Presenting valid proximity tag, while the system is armed, causes the system to disarm. Presenting valid proximity tag, while the system is disarmed, causes the system to be armed in AWAY (optional HOME) mode. To enroll / delete proximity tags, refer to figure 4.2.
**Figure 4.2 - Enrolling / Deleting Wireless Devices / Keyfobs / Wireless Commanders / Wireless Sirens**

* Keyfob & proximity tags enrolling can be performed by the installer or by the user (via USER SETTINGS menu).

** A black box in the display means that a device is enrolled (the system has learned its ID). No black box indicates that the device is not enrolled.

*** Initiate either normal transmission or the device tamper function (see ENROLLING TYPE, Par. 4.2.2).

**** Select "higher" sensitivity for far wireless device, "lower" for near devices.

---

D-300885 13
4.3 DEFINING ZONE TYPES, NAMES & CHIME ZONES

This mode allows you to assign one of 13 zone types to each of the system's 30 (wireless & wired) zones. In addition, it also allows you to assign a name to each zone and determine whether the zone will operate as a chime zone (only while the system is in the disarmed or Home arming state). When a chime zone is triggered, chime melody or zone name is heard (there are 3 selectable chime modes - Melody chime, Zone Name Chime or Chime Off).

A list of factory defaults is printed on table 1. You may fill out the blank columns even before you start and proceed to program according to your own list.

**Remember!**
A delay zone is also a perimeter zone by definition.
Zone types are fully explained in Appendix D.

Table 1 - DEFAULT AND PROGRAMMED ZONE DEFINITIONS
**4.4 DEFINING CONTROL PANEL PARAMETERS**

### 4.4.1 Preliminary Guidance

This mode allows you to customize the control panel and adapt its characteristics and behavior to the requirements of the particular user. An illustrated process is shown in figure 4.4. In this illustration, each selected option is displayed with a dark box at the right side. To review the options, repeatedly click or button, until the desired option is displayed, then click SHOW/OK button.

### 4.4.2 Entry Delays 1&2

(Fig. 4.4, location 01, 02). Two different entry delays allow the user to enter the protected site (while the system is in the armed state) via 2 specific doors and routes without causing an alarm. Following entry, the user must disarm the control panel before the entry delay expires. Slow-rate warning beeps start sounding once the door is opened, until the last 10 seconds of the delay, during which the beeping rate increases. Locations No. 1 (entry delay 1) and 2 (entry delay 2) allow you to program the length of these delays. Available options for each delay are: 00s, 15s, 30s, 45s, 60s, 3m, and 4m.

### 4.4.3 Exit Delay

(Fig. 4.4 location 03). An exit delay allows the user to arm the system and leave the protected site via specific routes and doors without causing an alarm. Slow-rate warning beeps start sounding once the arming command has been given, until the last 10 seconds of the delay, during which the beeping rate increases. Location No. 3 allows programming of the exit delay length. Available options are: 30s, 60s, 90s, 120s, 3m, 4m.

### 4.4.4 Bell Time

(Fig. 4.4, location 04). Here you select the length of time the bell (or siren) is allowed to function upon alarm. The bell time starts upon activation of the siren. Once the bell time expires, the siren is automatically shut down. Available options are: 1, 3, 4, 8, 10, 15 and 20 minutes.

### 4.4.5 Abort Time

(Fig. 4.4 location 05). Here you select the length of time allowed by the system to abort an alarm (not applicable to alarms from FIRE, 24H SILENT, EMERGENCY, GAS and FLOOD zones). The PowerMaxComplete is programmed to provide an “abort interval” that starts upon detection of an event. During this interval, the buzzer sounds a warning but the siren remains inactive and the alarm is not reported. If the user disarms the system within the allowed abort interval, the alarm is aborted. Available options are: 00s, 15s, 30s, 45s, 60s, 2m, 3m, 4m.

### 4.4.6 Alarm Cancel

(Fig. 4.4, location 06). Here you determine the “cancel alarm” period that starts upon reporting an alarm to the central station. If the user disarms the system within that time period, a “cancel alarm” message is sent to the central station. Available options are: 1, 5, 15, 60 minutes, 4 hours and also cancel inactive.

### 4.4.7 Quick Arm

(Fig. 4.4, location 07). Here you determine whether the user will be allowed to perform quick arming or not. Once quick arming is permitted, the control panel does not request a user code before it arms the system. The two options are: quick arm ON and quick arm OFF.

### 4.4.8 Bypass

(Fig. 4.4, location 08). Here you permit either manual bypassing of individual zones (through the USER SETTINGS menu), or allow the system to “force arm” (perform automatic bypassing) of open zones during the exit delay. If desired, press the arming key twice if you want to eliminate the delay beeps that continue during a force arming. If a zone is open and forced arming is not permitted, “NOT READY” is displayed and the system does not arm (the “Sad Melody” will sound). If “no bypass” is selected, neither manual bypassing nor force arming is allowed. Options: manual bypass, force arm and no bypass.

### 4.4.9 Exit Mode

(Fig. 4.4, location 09). Here you determine whether the exit delay will restart if the exit / entry door is reopened before the exit delay expires. Restarting the exit delay is helpful if the user re-enters immediately after going out to retrieve an item that he left behind. Three types of exit mode are available:

- **Restart Exit** - Exit delay restarts when the door is reopened during exit delay. The restart occurs once only.
- **Off by door** - When the door is closed, the exit delay is automatically terminated (even if the defined exit delay was not completed).
- **Normal** - The exit delay is exactly as defined, regardless of whether the door is open or closed.
4.4.10 Piezo Beeps
(Fig. 4.4, location 10). Here you determine whether warning beeps will sound or muted during exit and entry delays. An additional option is to mute the warning beeps only when the system is armed “HOME”.
Options: enable beeps, off when home and disable beeps.

4.4.11 Trouble Beeps
(Fig. 4.4, location 11). Under trouble conditions, the sounder emits a series of 3 short beeps once per minute. Here you determine whether this special beeping sequence will be active, inactive, or just inactive at night (the range of “night” hours is defined in the factory). The 3 options are: enable beeps, off at night (8 PM through 7 AM) and disable beeps.

4.4.12 Panic Alarm
(Fig. 4.4, location 12). Here you determine whether the user will be allowed to initiate a panic alarm by simultaneous pressing either the two panic buttons (on the keypad / wireless commander) or away + home (on a keyfob transmitter). Audible panic activates the siren and simultaneously transmits a message via telephone. Silent panic only transmits a message via telephone. The options are: silent panic, audible panic and disable panic.

4.4.13 Swinger Stop
(Fig. 4.4, location 13). Here you determine how many times eastern is allowed to initiate an alarm within a single arming period (including tamper & power failure events of detectors, PowerMaxComplete and wireless siren). If the alarms number from a specific zone exceeds the programmed number, the control panel automatically bypasses the zone to prevent recurrent siren noise and nuisance reporting to the central station. The zone will be reactivated upon disarming, or 48 hours after having being bypassed (if the system remains armed).
Available options are: shut after 1, shut after 2, shut after 3 and no shutdown.

4.4.14 Cross Zoning
(Fig. 4.4, location 14). Here you determine whether cross zoning will be active or inactive. Cross zoning is a method used to counterfeit false alarms - an alarm will not be initiated unless two adjacent zones are violated within a 30-second time limit.
This feature is active only when arming AWAY and only with zone couples from zone No. 18 to 27 (18 and 19, 20 and 21, etc.). You may use any one of these zone couples to create a “cross-zoned” area.
Note: If one of two crossed zones is bypassed (see Para. 4.4.8), the remaining zone will function independently.
Note: Every 2 crossed zones must be of the allowed zone type (Interior, Perimeter, Perimeter follower)
The options are: cross zone ON and cross zone OFF.
Cross zoning is not applicable in Entry/ Exit zones and 24h zones (Fire, Emergency, 24h audible, 24h silent).

4.4.15 Supervision
(Fig. 4.4, location 15). Here you determine the time limit for reception of supervision reports from various supervised wireless devices. If any device does not report at least once within the selected time limit, an “INACTIVITY” alert is initiated. The options are: 1, 2, 4, 8, 12 hours and disable.

4.4.16 NOT READY
(Fig. 4.4, location 16). Here you determine if the system will be NOT READY status when there is a supervision failure. In the “in supervision” mode, the system will be in NOT READY status if during the last 20 minutes a supervision message was not received. Options: normal and in supervision.

4.4.17 AUX Button A
(Fig. 4.4, location 17). Here you select the function of the AUX button on keyfob transmitters and wireless commanders MCM-140+. Four options are offered for each AUX button:
- Status (applicable only to control panel that includes voice option): Pressing the AUX button will cause the control panel’s voice module to announce the system status.
- Instant: Pressing the AUX button while the exit delay is in progress will cause the system to arm “instant” (the entry delay is canceled).
- Skip exit delay: Pressing the AUX button will immediately cause the system to arm “instant”.
- Panic: Pressing the AUX button will activate the PGM output (see further programming under “DEFINE OUTPUTS”, par. 4.8).

4.4.19 Jam Detect
(Fig. 4.4, location 19). Here you determine whether jamming (interfering trans- missions, on the radio channel used by the system) will be detected and reported or not.
If a jam detection option is selected, the system does not allow arming under the relevant jamming conditions.
Jam Detection Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Detection and Reporting when</th>
</tr>
</thead>
<tbody>
<tr>
<td>UL (20/20) (USA standard)</td>
<td>There is continuous 20 seconds of jamming</td>
</tr>
<tr>
<td>EN (30/60) (Europe standard)</td>
<td>There is an accumulated 30 seconds of jamming within 60 sec.</td>
</tr>
<tr>
<td>class 6 (30/60) (British standard)</td>
<td>Like EN (30/60) but the event will be reported only if the jamming duration exceeds 5 minutes.</td>
</tr>
<tr>
<td>Disabled</td>
<td>(no jamming detection and reporting).</td>
</tr>
</tbody>
</table>

4.4.20 Latchkey
(Fig. 4.4, location 20). Here you determine whether the system can be armed in the latchkey mode. If the system is armed this way, a “latchkey” message will be sent to specific telephones upon disarming by a “latchkey user” (users 5-8 or keyfob transmitters 5-8). This mode is useful when parents at work want to be informed of a child’s return from school. You can record a name for latchkey users.
The options are: Latchkey ON and Latchkey OFF.

4.4.21 “Not Active”
(Fig. 4.4, location 21). Here you determine the time limit for reception of signals from sensors used to monitor the activity of sick, elderly or disabled people. If no device detects and reports movement at least once within the defined time limit, a “not-active” alert is initiated.
Options: 3, 6, 12, 24, 48, 72 hours and no act disable.
4.4.22 Back Light
(Fig. 4.4, location 22). Here you determine whether the keypad back lighting will remain on at all times or will come on when a key is pressed and go off within 10 seconds if no further keystrokes are sensed. The two options are: always on and off after 10 s.

4.4.23 Duress
(Fig. 4.4, loc. 23). A duress alarm (ambush) message can be sent to the central station if the user is forced to disarm the system under violence or menace. To initiate a duress message, the user must disarm the system with the duress code (2580 by default). Here you can change the code digits or enter "0000" to disable the duress feature. The system does not allow the user to program the duress code saved in this memory location as an existing user code.

4.4.24 Piezo Siren
(Fig. 4.4, location 24). Here you determine whether the internal siren will sound or remain silent upon alarm (according to the user preference). Options: piezo siren on, piezo siren off.

4.4.25 Reset Option
(Fig. 4.4, location 25) (Not applicable in the USA)
Here you determine whether the system can be rearmed after an event by the user or only by the installer. Options: user reset or engineer reset.
If Engineer Reset is selected, the system can be rearmed only by the installer; by entering and exiting the installer menu, by entering and exiting the event log (see section 7), or by remote telephone. To perform Engineer Reset via the telephone, establish communication with the PowerMaxComplete (see user guide, par. 6.3A, steps 1-5) and continue as follows:

a. press [*], [installer code], [#]
b. Wait for 2 beeps
c. press [*], [1], [#]
d. press [*], [99], [#]

4.4.26 Tamper Option
(Fig. 4.4, location 26). Here you determine whether zone tamper will be reported or ignored. Available options are: zone tamper ON and zone tamper OFF.

4.4.27 Siren On Line
(Fig. 4.4, location 27). Here you determine whether the siren will be activated or not when the telephone line fails during system armed state. Available options are: enable on fail, disable on fail.

4.4.28 Memory Prompt
(Fig. 4.4, location 28). Here you determine whether the user will receive indication that an alarm has been activated. Available options are: enable and disable.

4.4.29 Disarm Option
(Fig. 4.4, location 29). Here you determine when it is possible to disarm the system:
A. Any time,
B. In AWAY mode, during entry delay, by using the PowerMaxComplete keypad or wireless device (keyfob).
C. In AWAY mode, during entry delay, by using a wireless device (keyfob) only (this is set as a default in UK to comply with DD423).
D. During entry delay, or by using the PowerMaxComplete keypad in AWAY mode.
Options: any time, on entry all, on entry wireless, or entry + away kp.

4.4.30 Bell/Rep. Option
(Fig. 4.4, location 30). Here you determine whether an alarm will be initiated (siren / report) when there is a supervision / jamming failure during AWAY arming state. Available options are: "EN standard" and other. When "EN standard" is selected, if there is supervision / jamming failure during AWAY arming, the siren is activated and the events are reported as tamper events. When "Other" is selected, there is no such activity during AWAY arming.

4.4.31 Low-Bat Ack
(Fig. 4.4, location 31). Here you determine whether the user will hear or will not hear low battery sound when he tries to disarm the system with a keyfob whose battery voltage is low.
Available options are: keyfob L-B on (the user has to acknowledge the keyfob low battery message) or keyfob L-B off (the user does not have to acknowledge the keyfob low battery message).

4.4.32 Screen Saver
(Fig. 4.4, location 32). Here you can determine that if no key is pressed during more than 30 seconds, the display will be "PowerMax" (to prevent possible intruder of knowing the system status). You can determine that normal display will return after pressing the button followed by entering user code (Refresh by Code) or after pressing any key (Refresh by Key).
If Refresh by Key is selected, the first pressing of any key (except Fire and Emergency) will cause normal display return and the second press will perform the key function. Regarding the Fire and Emergency keys, the first key press will cause normal display return and also will perform the Fire/Emergency function.
Options: scrn saver OFF, refresh by code, refresh by key.

4.4.33 Confirm Alarm
(Fig. 4.4, location 33). Here you determine that if 2 successive alarms will occur during a specific period, the second alarm will be considered as a confirmed alarm (for confirmed alarm reporting, see par. 4.5.12 REPORT CNF ALARM).
Options: disable 30 min, 45 min, 60 min, or 90 min.

4.4.34 AC FAIL REP
(Fig. 4.4, location 34). Here you determine the time interval between AC power failure occurrence and the failure reporting. Options: 5 minutes, 30 minutes, 60 minutes or 180 minutes.

4.4.36 User Permission
(Fig. 4.4, location 36). Here you determine whether the access to the INSTALLER MODE requires user permission. If you select ENABLE, the installer mode will be accessible only through the user menu after entering the user code.
Options: Enable, Disable.

4.4.38 Battery Type
(Fig. 4.4, location 38). Here you determine which type of battery pack is used, so that the system will supply proper charge current.
Options: 7.2V or 9.6V.
Figure 4.4 - DEFINE PANEL Flow Chart

Note: The currently saved options are displayed with a dark box at the right side of the display. To review the options, repeatedly click [OK] or [ESC] until the desired option is displayed, then click [OK] (a dark box will be displayed at the right side).

Note: Force arm is not applicable to the UK.

Note: Duress code is not applicable to the UK.
4.5 DEFINING COMMUNICATION PARAMETERS

Preliminary Guidance

This mode allows you to adapt the telephone communication parameters to the local requirements.

Compatible central station receivers are:
Osborne-Hoffman model 2000, Ademco Model 685,

IMPORTANT: In telephone / pager number locations and account number locations, you may be required to enter hexadecimal digits. In telephone number locations, these digits are used as codes to control the dialer:

<table>
<thead>
<tr>
<th>Hex</th>
<th>Digit</th>
<th>Keying</th>
<th>Significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>0-9</td>
<td>#</td>
<td>Applicable only at the beginning of a number - the dialer waits 10 seconds or waits for dial tone, whichever comes first and then dials.</td>
</tr>
<tr>
<td>B</td>
<td>#</td>
<td>C</td>
<td>Inserts an asterisk (%)</td>
</tr>
<tr>
<td>C</td>
<td>#</td>
<td>D</td>
<td>Applicable only at the beginning of a number - the dialer waits 5 seconds for dial tone and goes on hook if none is received.</td>
</tr>
<tr>
<td>D</td>
<td>#</td>
<td>E</td>
<td>Applicable only in the middle of the number - the dialer waits 5 seconds</td>
</tr>
<tr>
<td>E</td>
<td>#</td>
<td>F</td>
<td>Not applicable in phone numbers</td>
</tr>
</tbody>
</table>

To enter a series of digits, use the following keys:

- moves the cursor from left to right
- moves the cursor from right to left
- deletes everything after the cursor (to the right).

4.5.1 Autotest Time
(Fig. 4.5, location 01). Here you determine the time at which the telephone line will be tested and reported to the central station.

4.5.2 Autotest Cycle
(Fig. 4.5, location 02). Here you determine the time interval between consecutive telephone line test messages sent to the central station. The control panel performs this at regular intervals to verify proper communications.

The options are: test every 1, 5, 7, 14, 30 days and test off.

4.5.3 Area Code
(Fig. 4.5, location 03). Here you enter the system tel. area code (up to 4 digits).

4.5.4 Out Access No
(Fig. 4.5, location 04). Here you enter the number that is used as a prefix to access an outside telephone line (if exists).

4.5.5 First Central Station Tel.
(Fig. 4.5, loc. 05). Here you program telephone number of the 1st central station (including area code, 16 digit max) to which the system will report the event groups defined in memory location 11 (see note in Fig. 4.5).

4.5.6 First Account No.
(Fig. 4.5, location 06). Here you enter number that will identify your specific alarm control system to the first central station. The number consists of 4 or 6 hexadecimal digits (see note in Fig. 4.5).

4.5.7 2nd Central Station Tel
(Fig. 4.5, loc. 07). Here you program telephone number of the 2nd central station (including area code, 16 digit max) to which the system will report the event groups defined in memory location 11 (see note in Fig. 4.5).

4.5.8 Second Account No.
(Fig. 4.5, loc. 08). Here you enter number that will identify your system to the 2nd central station. The account number consists of 4 or 6 hexadecimal digits (see note in Fig. 4.5).

4.5.9 Report Format
(Fig. 4.5, location 09). Here you select the reporting format used by the control panel to report events to central stations (see note in figure 4.5). The options are: Report FORMAT (see note in Fig. 4.5). The options are: 10, 20, 30, 33 and 40 pps.

4.5.10 4/2 Pulse Rate
(Fig. 4.5, location 10). Here you select the pulse rate at which data will be sent to central stations if any one of the 4/2 formats has been selected in Location 09 REPORT FORMAT (see note in Fig. 4.5). The options are: 4/2 1800/2300 Scancoom (see Appendix C - code lists).

4.5.11 Reporting to Central Stations
(Fig. 4.5, location 11) (see note in Fig. 4.5).

To enter a series of digits, use the following keys:

- moves the cursor from left to right
- moves the cursor from right to left
- deletes everything after the cursor (to the right).

The selectable options are as follows:

<table>
<thead>
<tr>
<th>Plan name</th>
<th>Sent to center 1</th>
<th>Sent to center 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>all -o/c * backup</td>
<td>All but open/clo</td>
<td>All but openclose if center 1 doesn't respond</td>
</tr>
<tr>
<td>all * all</td>
<td>All</td>
<td>All</td>
</tr>
<tr>
<td>all -o/c * all -o/c</td>
<td>All but open/close</td>
<td>All but open/close</td>
</tr>
<tr>
<td>all -o/c * o/c</td>
<td>All but open/close</td>
<td>Open/close</td>
</tr>
<tr>
<td>all (-alrt) * alrt</td>
<td>All but alerts</td>
<td>Alerts</td>
</tr>
<tr>
<td>Alrm * all (–alrm)</td>
<td>Alarms</td>
<td>All but alarms</td>
</tr>
<tr>
<td>Disable report</td>
<td>Nothing</td>
<td>Nothing</td>
</tr>
<tr>
<td>all * backup</td>
<td>All</td>
<td>All if cent. 1 doesn't respond</td>
</tr>
</tbody>
</table>

Note: “All” means that all 3 groups are reported and also trouble messages - sensor / system low battery, sensor inactivity, power failure, jamming, communication failure etc.

4.5.12 Report CNF Alarm
(Fig. 4.5, location 12). Here you determine whether the system will report whenever 2 or more events (confirmed alarm) occur during a specific period (see par. 4.4.33 and note in figure 4.5).

Available options are: enable report, disable report, enable + bypass (enabling report and bypassing the detector - applicable to PowerMaxComplete that is compatible with DD423 standard).

4.5.13 Send 2WV Code
(Fig. 4.5, location 13). Here you determine whether the system will send two-way voice code to the central station (to turn the central station from data communication to voice communication state) by using pre-selected SIA or Contact-ID communication format only (see note in Fig. 4.5). Options: send and don't send.
4.5.14 Two-Way Voice Central Stations
(Fig. 4.5, loc. 14). (See note in Fig. 4.5) - Optional - applicable only in PowerMaxComplete that includes "voice" feature.

Here you select the timeout for 2-way voice communication with Central Stations, or enable the central station to ring back for 2-way voice function. This option is applicable only after reporting an event to the central station. (The central station person can press [3] for listen-in, [1] for "speak out" or [6] for listening and speaking).

The options are: 10, 45, 60, 90, 10 sec, 2 minutes, ring back and disable (no two-way voice communication).

**Note:** If "Ring Back" is selected, you should select "Disable Report" for private telephone (see par. 4.5.20 - Reporting to Private Telephones), otherwise the central station will establish communication with the PowerMaxComplete (after an event occurrence) in the normal manner (and not after one ring).

4.5.15 Ring Back Time
(Fig. 4.5, location 15). Here you determine the period during which the central station can establish 2-way voice communication with the PowerMaxComplete (after 1 ring), if:
A. Alarm type message was received by central station.
B. Ring Back function was selected (see par. 4.5.14).

The options are: 1, 3, 5 or 10 min. (see note in Fig. 4.5).

4.5.16 Dialing Attempts
(Fig. 4.5, location 16). Here you determine how many times the communicator will dial the central station's number. (see note in Fig. 4.5).

The options are: 2, 4, 8, 12, and 16 attempts.

**Attention!** A maximum of 2 dialing attempts is permitted by the Australian Telecommunication Authority.

4.5.17 Set Private Tel. No.
(Fig. 4.5, location 17). Here you program the four telephone numbers (including area code) of the private subscriber to which the system will report the event groups defined in Location 20.

4.5.18 Two-Way Voice - Private Phones
(Fig. 4.5, location 18) - Optional - applicable only in PowerMaxComplete that includes "voice" feature.

Here you determine whether 2-way voice communication with private telephones will be allowed or not.
The two options are: enable 2-way and disable 2-way.

4.5.19 Private Tel. Dialing Attempts
(Fig. 4.5, location 19) Here you determine how many times the communicator will dial the called party's number (private telephone).
The options are: 1, 2, 3 and 4 attempts.

**Attention!** A maximum of 2 dialing attempts is permitted by the Australian Telecommunication Authority.

4.5.20 Reporting to Private Telephones
(Fig. 4.5, location 20)
Here you determine which event groups will be reported to private telephone subscribers. The options are as follows:

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>All messages</td>
</tr>
<tr>
<td>all (-op/cl)</td>
<td>All messages, except open/close</td>
</tr>
<tr>
<td>all (-alerts)</td>
<td>All messages, except alerts</td>
</tr>
<tr>
<td>alarms</td>
<td>Alarm messages</td>
</tr>
<tr>
<td>alerts</td>
<td>Alert messages</td>
</tr>
<tr>
<td>op/cl</td>
<td>Open/close</td>
</tr>
<tr>
<td>disable</td>
<td>No message will be reported</td>
</tr>
</tbody>
</table>

**Note:** "All" means all events including the L. BAT and AC FAIL trouble messages.

4.5.21 Tel. Acknowledge
(Fig. 4.5, location 21). Here you determine whether the system will use the single acknowledge or the all acknowledge mode when reporting to private telephones.

**Note:** In the single acknowledge mode, receiving an acknowledge signal from a single telephone is sufficient to consider the current event closed and call off the communication session. The remaining telephones serve for backup purposes only. In the all acknowledge mode, an acknowledge signal must be received from each telephone before the current event is considered reported.
The options are: single ack and all ack.

4.5.22 Pager Tel. No.
(Fig. 4.5, location 22). Here you program the telephone number (including area code) of the pager to which the system will report (if any).

4.5.23 Pager’s PIN No.
(Fig. 4.5, location 23). Here you enter the pager’s PIN code - a digital sequence that is the pager’s address. The paging company’s computer needs this input for routing messages to the specific pager. The PIN sequence precedes any digital message that the PowerMaxComplete sends to the pager to report an event. It may include digits, pauses and special characters (# or #). Call the paging company to find out what the pager’s PIN code should consist of.

**Important!** In this location, special characters can be entered as shown below:

<table>
<thead>
<tr>
<th>To Insert</th>
<th>Keying Sequence</th>
<th>Character Displayed</th>
</tr>
</thead>
<tbody>
<tr>
<td>#</td>
<td>&lt;#&gt; ⇒ &lt;+1&gt;</td>
<td>B</td>
</tr>
<tr>
<td>#</td>
<td>&lt;#&gt; ⇒ &lt;+2&gt;</td>
<td>C</td>
</tr>
<tr>
<td>5 sec pause</td>
<td>&lt;#&gt; ⇒ &lt;+3&gt;</td>
<td>E</td>
</tr>
</tbody>
</table>

Enter the pager’s PIN number (up to 16 digits, including special characters, depending on pager system protocol).

4.5.24 Reporting to a Pager
(Fig. 4.5, loc. 24). Here you determine which event groups will be reported to the pager. (For the abbreviations, refer to par. 4.5.11).
The options are: all, alarms + alerts, all (-op/cl), trbl + op/cl, trbl, op/cl, disable report

4.5.25 Recent Closure
(Fig. 4.5, location 25). Here you enable or disable the “recent closing” report, that is sent to the central station if an alarm occurs within 2 minutes from the expiry of the exit delay.
The options are: recent close ON and recent close OFF.

4.5.26 Remote Access
(Fig. 4.5, location 26). Here you give or deny permission to access the system and exercise control from a remote telephone.
The options are: rem. access ON and rem. access OFF.

4.5.27 Mast. DL Code
(Fig. 4.5, location 27). Here you determine the master installer 4-digit password for downloading/uploading data into/from the PowerMaxComplete memory. (See note in Fig. 4.5).

**Attention!** If "0000" is used, it will not enable connection of the PowerMaxComplete to the PC for upload/download purpose.
Note
For Control Panel that has installer code & master installer code, the following functions are available only if the MASTER INSTALLER code is entered:
05: 1ST CNTR TEL
06: 1ST ACCOUNT #
07: 2ND CNTR TEL
08: 2ND ACCOUNT #
09: REPORT FORMAT
10: 4/2 PLS RATE
11: REPORT CNTR
12: RPRT CNF ALRM
13: SEND 2WV CODE
14: VOICE C.S.
15: RINGBACK TIME
16: DIAL ATTEMPTS
27: MAST. DL CODE

Note
The currently saved options are displayed with dark box at the right side of the display. To review the options, repeatedly click on or until the desired option is displayed, then click OK (a dark box will be displayed at the right side).

Figure 4.5 - DEFINE COMM Flow Chart
4.5.28 Inst. DL Code
(Fig. 4.5, location 28). Here you determine the installer 4-digit password for downloading data into the PowerMaxComplete memory.

Attention! If "0000" is used, it will not enable connection of the PowerMaxComplete to the PC for upload/download purpose.

4.5.30 Zone Restore
(Fig. 4.5, location 30). Here you determine whether a zone restore will be reported or not. Options: report restore and don’t report.

4.5.31 Upload Option
(Fig. 4.5, location 31). Here you determine whether the PowerMaxComplete data can be uploaded into a computer while the system is in disarm state or any time (in HOME/AWAY arming & disarm state). The options are: when system OFF and any time.

4.5.32 Dialing Method
(Fig. 4.5, location 32). Here you determine the dialing method used by the automatic dialer built into the PowerMaxComplete control panel.
The options are: Pulse and DTMF (tone).

4.5.33 Line Failure Report
(Fig. 5, loc. 33). Here you determine if the telephone line disconnection will be reported or not and determine the delay between detection of line disconnection and the failure reporting. If the telephone line is disconnected, the message "tel line fail" will be stored in the event log.
The options are: don’t report, immediately, 5 minutes, 30 minutes, 60 minutes or 180 minutes.

4.5.34 UL/DL Tel. Number
(Fig. 4.5, loc. 34). Here you enter the telephone number (up to 16 digits) of the UL/DL server.

Note: Only for use with panels monitored by compatible central stations. Leave empty if not being used.

4.5.35 System Inactivity Report
(Fig. 4.5, loc. 35). Here you determine whether the central station will receive a message if the system is inactive (not armed) during a defined period (days).
The options are: disable, rep. after 7d, rep. after 14d, rep. after 30d, rep. after 90d.

4.5.36 Ambient Level
(Fig. 4.5 loc. 36). Applicable for USA only. In this section you select the ambient noise level of the installation. If it is relatively noisy environment, set it to High (default setting) If it is very quiet environment, set to Low.

4.6 DEFINING GSM PARAMETERS
This mode is applicable only if your PowerMaxComplete is connected to the internal / external GSM unit. By using this mode, you can:

1. Define that the GSM unit is installed / not installed.
2. Define 4 cellular phone numbers to which events will be reported via SMS text message.
3. Define which types of events will be reported to SMS phone numbers.
4. Define whether the GSM unit will serve as:
   - GSM IS BACKUP – The system will try to report events using the PSTN line, and if that fails, it will try the GSM line (SMS messages are always sent using the GSM line).
   - GSM IS PRIMARY – The system will try dialing using GSM line first, and if that fails, it will try the PSTN line (SMS messages are sent using GSM anyway).
   - GSM ONLY – The system will report events by using only the GSM line.
   - SMS ONLY – The system will not use GSM line for anything else than for SMS messages.
5. Define whether GSM line failure will not be reported, or will be reported after 2/5/15/30 minutes.

An illustrated process is shown in figure 4.6. In this illustration, each selected option is displayed with a dark box at the right side. To review the options, repeatedly click or button, until the desired option is displayed, then click button.

4.6.1 GSM Module Installation
Here you define whether the GSM Module is installed or not installed. Available options are: installed or not installed.

4.6.2 1st, 2nd, 3rd & 4th SMS Number
Here you define the first, second, third and fourth SMS phone number (including area code, 16 digits maximum) to which pre-selected events types (see next paragraph) will be reported.

4.6.3 Reporting to SMS Phone Number
Here you determine the types of events that will be reported to the pre-selected SMS phone numbers.

Event messages are divided by type into three groups:

<table>
<thead>
<tr>
<th>GROUP</th>
<th>EVENTS REPORTED</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alarms</td>
<td>Fire, Burglary, Panic, Tamper</td>
</tr>
<tr>
<td>Open/Close</td>
<td>Arming AWAY, Arming HOME, Disarming</td>
</tr>
<tr>
<td>Alerts</td>
<td>No-activity, Emergency, Latchkey</td>
</tr>
</tbody>
</table>

The selectable options are detailed in the next table.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>All event types</td>
</tr>
<tr>
<td>all (-op/cl)</td>
<td>All event types except open/close</td>
</tr>
<tr>
<td>all (-alerts)</td>
<td>All event types except alerts</td>
</tr>
<tr>
<td>Alarms</td>
<td>Alarms only</td>
</tr>
<tr>
<td>Alerts</td>
<td>Alerts only</td>
</tr>
<tr>
<td>op/CL</td>
<td>Open/close only</td>
</tr>
<tr>
<td>Disable report</td>
<td>No events reporting</td>
</tr>
</tbody>
</table>

Note: "All" means that all 3 groups are reported and also trouble messages - sensor / system low battery, sensor inactivity, power failure, jamming, communication failure etc.
4.6.4 GSM Line Failure Reporting
Here you determine whether GSM network failure will be reported after 2 min., after 5 minutes, after 15 min., or after 30 minutes. Available options: don't report, 2 min, 5 min, 15 min, or 30 min.

4.6.5 GSM Line Purpose
Define whether the GSM unit will serve as a backup for the regular telephone line, as a primary communication channel or as the only telephone channel or for sending SMS only. Available options are: GSM is backup, GSM is primary, GSM only or SMS only.

4.8 DEFINING OUTPUT PARAMETERS

4.8.1 Preliminary Guidance
This mode allows you:
- a. Events/conditions selection under which PGM (programmable) output will function.
- b. Selection of the internal siren or STROBE light (that will be activated according to system programming).

4.8.2 Define PGM
For the PGM output, you can select disable, turn on, turn off or pulse active (turn on for predefined period, selected by PULSE TIME), as follows:
- BY ARM AWAY (upon AWAY arming).
- BY ARM HOME (upon HOME arming).
- BY DISARM (upon disarming).
- BY MEMORY (activated upon registration of an alarm in the memory, turned off upon memory clearing).
- BY DELAY (during exit / entry delays).
- BY KEYFOB (upon AUX button pressing in the keyfof transmitter / MCM-140+, if "PGM" is selected in "Define Panel" menu, locations 17 and 18).
- BY ZONES (by disturbance in each of 3 selected zones, irrespective of arming / disarming). If you select toggle, the PGM output will be turned on upon event occurrence in these zones and will be turned off upon next event occurrence, alternately.
- BY LINE FAIL: PGM output is ON if telephone line is disconnected.

4.8.3 Defining INT/STRB
Here you determine whether the INT output will be used for an internal siren or for a strobe. If strobe is selected, the INT output will be activated when an alarm occurs until the system is disarmed and rearmed again (i.e. clearing alarm memory).

4.8.4 PGM General Definition
Here you determine the PGM LOCKOUT TIME - daytime limits between which PGM output (that is controlled by sensors) will be off even when the associated sensors are triggered. To disable the lockout time, the START and STOP times should be identical (see figure 4.8).
**4.9 DEFINE VOICE**

**DEFINE VOICE** is optional - applicable only in PowerMaxComplete that includes "voice" feature

### 4.9.1 Record Speech

This mode allows you to record short-duration speech messages for the following purposes:

- **House identity** is a message announced automatically when events are reported to private telephones.
- **4 User Names** can be recorded and assigned to users numbered 5-8. In case of event, the relevant user name will be added to the message that will be reported via the telephone.

(see figure 4.1a)

- **5 custom zone names** can be recorded and assigned to specific zones. These names are useful if none of the 26 fixed zone names are found suitable for a certain zone (see Fig. 4.3).

The recording process is shown below.

### 4.9.2 Voice Box Mode

This mode allows you to determine whether two-way voice communication is to be sounded either via the optional external speech box, via the PowerMaxComplete, or via both. Options: **No Voice Box**, **Voice Box Only** or **Voice Box Mixed**.

**Voice Box Mode**

- **No Voice Box**
- **Voice Box Only**
- **Voice Box Mixed**

---

* Upon selecting any one of the 3 options (zone a, b and c) you may enter a zone number and then select "disable", "turn on", "turn off", "pulse active" or "toggle".

** The currently saved option is displayed with a dark box at the right side. To review the options, repeatedly click button until the desired option is displayed, then click (a dark box will be displayed at the right side).

**The recording process is shown below.**

---

**Figure 4.9 - Speech Recording Flow Chart**

* RECORD MESSAGE is displayed momentarily. The dark square boxes slowly disappear, one by one, until end of recording time.

** To check the recorded message, press the key and listen to the playback.
4.10 DIAGNOSTIC TEST

This mode allows you to test the function of all protected area wireless sensors / wireless sirens / wireless keypads and to receive / review information regarding the received signal strength. Three reception levels are sensed and reported:

Received Signal Strength Indication:

<table>
<thead>
<tr>
<th>Reception</th>
<th>Buzzer Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Strong</td>
<td>Happy Tune twice ( - - - –––– ) ( - - - ––––)</td>
</tr>
<tr>
<td>Good</td>
<td>Happy Tune ( - - - ––––)</td>
</tr>
<tr>
<td>Poor</td>
<td>Sad tune ( ––––––––)</td>
</tr>
</tbody>
</table>

The diagnostic test process is shown in figure 4.10.

When you are instructed to perform "walk test", walk throughout the site to check the detectors / sensors. When a detector/sensor is triggered into alarm, its name, number and the alarm reception level should be indicated (for example, "Bathroom", "Z19 strong") and the buzzer should sound according to the alarm reception level (1 of 3).

IMPORTANT! Reliable reception must be assured. Therefore, a "poor" signal strength is not acceptable. If you get a "poor" signal from a certain detector, re-locate it and re-test until a "good" or "strong" signal strength is received. This principle should be followed during the initial testing and also throughout subsequent system maintenance.

(see figure 4.1a)

4.11 USER FUNCTIONS

This mode provides you with a gateway to the user functions through the regular user programming menu. You may:

- Program the 4 (private) telephone numbers
- Program user codes
- Enroll keyfobs
- Enroll proximity tags
- Select the voice option
- Set the auto arm option
- Set arming time
- Set the squawk option
- Set the system time and time format
- Set the date and date format
- Set the time scheduler

Refer to the User Guide for detailed procedures.

Caution! If after having programmed the user codes the system does not recognize your installer code, this indicates you must have programmed a user code that is identical with your installer code. If so, access the user menu and change the code that is identical with your installer code. This will re-validate your installer code.

4.12 RETRIEVING FACTORY DEFAULTS

If you want to reset the PowerMaxComplete parameters to the factory default parameters, you should enter the installer menu and perform the "FACTORY DEFLT" function, as described in the right side illustration. To get the relevant parameters defaults, contact the PowerMaxComplete dealer.

Note: For PowerMaxComplete with 2 installer codes, INSTALLER code and MASTER INSTALLER code, only the master installer code enables to perform factory default function.

Entering to/exit from the FACTORY… DEFALT menu is shown in figure 4.1a

4.13 SERIAL NUMBER

The menu "13. SERIAL NUMBER" enables reading the system serial number for support purposes only.
4.14 CALLING UPLOAD/DOWNLOAD SERVER

Note:
This option is only used during the installation of panels monitored by compatible central stations.

This option allows the installer to initiate a call to the upload/download server. The server uploads the PowerMaxComplete configuration to its database and can unload predefined parameters to the PowerMaxComplete.

Figure 4.14 – Start UL/DL

5. TESTING PROCEDURES

5.1 Preparations
Make sure all windows and doors are closed. If all zones are secured (undisturbed), the display should read:

**READY**  **HH:MM**

If the display is “NOT READY”, query the control panel by pressing the **OK** button repeatedly. The source(s) of the problem(s) will be displayed and read aloud. Take the necessary measures to eliminate the problem(s) before testing the system (see next paragraph).

5.2 Diagnostic Test
To verify proper function of all detectors in the system, a comprehensive diagnostic test is required. To perform this test, refer to figure 4.10.

5.3 Keyfob Transmitter Test
Initiate transmission from each transmitter enrolled as a keyfob unit (according to the list in Table A2, Appendix A). Use each transmitter to arm the control panel AWAY and immediately disarm it. Upon pressing the keyfob unit’s AWAY key, the ARM indicator should light. The display should respond as follows:

**ARMING AWAY**

The exit delay beeps will begin.
Press the keyfob unit’s DISARM (↓) key. The ARM indicator should extinguish, the announcement “Disarm, ready to arm” should be heard and the display should revert to:

**READY**  **HH:MM**

Test the AUX button in each keyfob in accordance with the information noted in Table A.2, Appendix A. Verify that the AUX button performs its duty as programmed.

- If the AUX (↑) button is defined as “STATUS”, system status should be displayed and announced upon pressing the button.
- If the AUX (↑) button is defined as “INSTANT”, press the AWAY button and then the AUX button. The response should be:

**ARMING INSTANT**

(alternating)

**PLEASE EXIT NOW**

and the exit delay beeps will start. Press the DISARM (↓) key immediately to disarm.

- If the AUX (↑) button is programmed as “PGM” and permitted to activate the PGM output, pressing (↑) should activate the device wired to the PGM output.
5.4 PGM output ON/OFF Test

Go over the table in Appendix B column by column. If, for instance, the “BY ARM AWAY” column has an “X” marked, then arm AWAY the system and verify that the appliance that is connected to PGM output is actually activated upon AWAY arming.

Continue in the same manner in the following columns, always creating the state or event that will activate the appliance that is connected to PGM output. Verify that it is activated as programmed.

**IMPORTANT!** Before testing “BY TIMER” and “BY ZONE”, make sure that these forms of control are permitted - click repeatedly and verify that the display shows:

- BY TIMER ON
- BY SENSOR ON

A dark box at the extreme right means that these functions are enabled.

5.5 Emergency Transmitter Test

Initiate transmission from each transmitter enrolled to an emergency zone (according to the list in Table A3, Appendix A). For example, upon pressing the transmit button of an emergency transmitter enrolled to zone 22, the display should read:

Z22 EMERGENCY

VIOLATED

It is advisable to let the central station know that you are conducting this test, or just disconnect the telephone line from the PowerMaxComplete during the test, to prevent false alarms.

6. MAINTENANCE

6.1 Dismounting the Control Panel

A. Remove the screw that fastens the front unit to the back unit (see figure 3.1H).

B. Remove the 3 screws that fasten the back unit to the mounting surface (see figure 3.1A) and remove the control panel.

6.2 Replacing the Backup Battery

Replacement and first-time insertion of battery pack is similar (see figure 3.1C).

With fresh battery pack, correct insertion and tightened battery compartment lid, the TROUBLE indicator should extinguish. However, the “MEMORY” message will now blink in the display (caused by the “tamper” alarm you triggered when opening the battery compartment lid). Clear it by arming the system and immediately disarming.

6.3 Fuse Replacement

The PowerMaxComplete has two internal fuses that have automatic reset. Therefore, there is no need to replace fuses.

When over current condition occurs, the fuse cuts off the circuit current. Upon fault current being removed for several seconds, the fuse is automatically reset and allows current flow through the circuit again.

6.4 Replacing/Relocating Detectors

Whenever maintenance work involves replacement or re-location of detectors, always perform a full diagnostic test according to par. 4.10.

**Remember!** A “poor” signal is not acceptable, as stated at the end of the test procedure.

7. READING THE EVENT LOG

Events are stored in the event log. You can access this log and review the events, one by one. If the event log fills up completely, the oldest event is deleted upon registration of each new event.

The date and time of occurrence are memorized for each event.

When reading the event log, events are shown in chronological order - from the newest to the oldest. Access to the event log is provided by clicking the key and not through the installer’s menu. Reading and erasing process of the event log is shown in the next drawing.

* While the system is in normal operation mode, click to review the event log.

** Event is displayed in 2 parts, for example, "Z13 alarm" then "09/02/00 3:37 P". The two displays will be shown alternately until clicking again to move to the next event or until the end of the event log (4 minutes).

*** Applicable only if installer code is entered.

Understanding the Scancom Reporting Protocol Data Format

The SCANCOM data format consists of 13 decimal digits divided into 4 groups, from left to right, as shown at the right side. Each channel is associated with a specific event as follows:

1st "C": Fire
2nd "C": Personal attack
3rd "C": Intruder
4th "C": Open/close
5th "C": Perimeter
6th "C": Alarm cancel
7th "C": Second alarm
8th "C": Trouble messages
9th "C": Gas
10th "C": Gas
11th "C": Gas
12th "C": Gas
13th "C": Gas

<table>

APPENDIX D. Programmable Zone Types

D1. Delay Zones
A delay zone has exit and entry delays set by you in the course of programming the system. Warning beeps will sound throughout these delays, unless you choose to mute them.
- **Exit Delay**: The exit delay begins once the user arms the system. It allows him to leave via interior zones and a doorway before arming actually takes effect. When the exit delay starts, the buzzer beeps slowly and maintains a slow beeping rate until the last 10 seconds, during which it beeps rapidly. The PowerMaxComplete has two types of delay zones, for which different delay times may be set.
- **Entry Delay**: The entry delay begins once the user enters the protected area via a specific doorway (his entry is sensed by a delay zone detector). To avoid an alarm, he must reach the keypad via interior zones (which become "follower zones" during the entry delay) and disarm the system before the delay expires. When the entry delay starts, the buzzer beeps slowly until the last 10 seconds, during which it beeps rapidly.

D2. Emergency Zones
You can provide incapacitated, sick or elderly people with a miniature single-button transmitter to be carried on the neck like a pendant or to be worn on the wrist like a watch. In distress situations, they can press the button on their transmitter, causing the PowerMaxComplete to send an emergency call to the central monitoring station or to private telephones designated by the installer.
To make this possible, define the required number of zones as emergency zones and enroll a portable transmitter to each one of these zones. When completed, ask the master user to distribute these transmitters to their potential users.

D3. Fire Zones
A fire zone uses smoke detectors and is permanently active (a fire alarm is triggered regardless of whether the system is armed or disarmed). Upon detection of smoke, a pulsating siren sounds immediately and the event is reported via the telephone line.

D4. Flood Zone
A flood zone is permanently active (a flood alarm is triggered regardless of whether the system is armed or disarmed). Upon detection of flood leak, the event is reported via the telephone line.

D5. Gas Zone
A gas zone is permanently active (a gas alarm is triggered regardless of whether the system is armed or disarmed). Upon detection of gas leak, the event is reported via the telephone line.

D6. Interior Zone
Interior zones are zones within the protected premises that have nothing to do with perimeter protection. Their most important feature is that they allow free movement within the protected area without initiating an alarm, provided that the system is armed in the "HOME" mode. People can therefore stay at home and move about freely, as long as they do not disturb a PERIMETER zone.

D7. Interior Follower Zones
"Interior Follower" zone is a zone that is located between entry/exit zone and the alarm system control panel. This zone is temporarily ignored by the alarm system during entry/exit delay periods, to enable you to walk (without causing an alarm) in front of a motion detector that is associated with the Interior Follower zone, after you enter through an entry zone on the way to the control panel, or when leaving the protected premises after system arming.

D8. Non-Alarm Zones
A non-alarm zone does not directly participate in the alarm system. Its main use is to perform auxiliary remote control tasks such as opening/closing a gate, activating/deactivating courtesy light and similar applications. No alarm, silent or otherwise, is associated with a non-alarm zone.
You can define the desired number of non-alarm zones and enroll a portable transmitter or a wireless device (detector) to this type of zone. Then, you must ensure that these zones are permitted to control the PGM output. Next, you can select the zones (3 at most) that will control PGM output.

Note: A PGM output control can also be carried out by holders of all keyfob transmitters, by pressing the AUX [+] button. This method will work provided that you programmed the [+] button for PGM control (see Par. 4.4.17), and that you programmed the PGM output to be controlled by keyfob transmitters (see par. 4.8).

D9. Perimeter Zones
Perimeter zones rely on detectors designed to protect doors, windows and walls. An immediate alarm is initiated when such a zone is violated by opening the door/window or by trying to break the wall.
D10. Perimeter Follower Zones
A non-entry/exit zone, typically a perimeter zone located on an entry/exit path, that is treated as an entry/exit zone during an entry/exit time.

D11. 24-Hour Zones
24 hour zones are mainly used for PANIC buttons, perimeter detectors and anti-tamper protection. They therefore trigger an alarm in both armed and disarmed states.

APPENDIX E. PowerMaxComplete Compatible Devices

E1. PowerMaxComplete Compatible Detectors
Each detector compatible with the PowerMaxComplete system is packed with its own installation instructions. Read them carefully and install as indicated.

A. PIR Motion Detectors
The wireless passive infrared (PIR) motion detectors used in the system are of the PowerCode type. The PowerMaxComplete is capable of “learning” each detector’s identification code and linking it to a specific zone (see par. 4.3 in this Guide). Some units are shown below:

- NEXT® K9-85 MCW
- MPPIR-3000 or K-940 MCW
- DISCOVERY K9-80/MCW

Note: K-940 MCW, Discovery K9-80/MCW and NEXT® K9-85 MCW are pet immune units.

In addition to its unique 24-bit identification code, each detector transmits a message, containing status information:
- The detector is in alarm (or not).
- The detector is being tampered with (or not).
- The battery voltage is low (or normal).
- “This is a supervisory message”.

If any of these detectors detects motion, it sends out a message to the alarm control panel. If the system is in the armed state, an alarm will be triggered.

B. Magnetic Contact Transmitter
MCT-302 is a PowerCode magnetic-contact transmitter used to detect the opening of a door or a window. The alarm contacts are closed as long as the door or window remains closed.

The unit has an extra alarm input that acts as if it were a separate wireless transmitter. It sends (or does not send) a "restored to normal" message to the alarm system, depending on the setting of an on-board “DIP” switch. The “restore” message informs you, through the control panel’s display, whether the door or window is open or closed.

C. MCT-100 Wireless Adapter for Wired Detectors
MCT-100 is a PowerCode device used mainly as a wireless adapter for 2 regular magnetic switches installed on 2 windows in the same room. It has two inputs, behaving as separate wireless transmitters with different PowerCode IDs. Each input sends (or does not send) a "restored" message to the alarm system, depending on the setting of an on-board “DIP” switch.

D. Wireless Smoke Detector
MCT-425. A photoelectric smoke detector equipped with a PowerCode-type transmitter. If enrolled to a fire zone, it initiates a fire alarm upon detection of smoke.

E. Glass Break Detector
MCT-501 An acoustic detector equipped with a PowerCode-type transmitter. Since it restores automatically after detection, this unit does not send a restoral message to the control panel.

E2 PowerMaxComplete Compatible Transmitters
The PowerMaxComplete system is compatible with multi-button and single button key-ring and hand-held transmitters that use PowerCode and CodeSecure coding methods.

Multi-button PowerCode transmitters transmit the same code each time the same button is pressed. They can be used for emergency signaling, for activating the PGM output. They can not be used for arming / disarming.

CodeSecure transmitters are of the rolling code type - they transmit a new code each time the same button is pressed. This provides a higher security level, especially in arming / disarming applications, because the code can not be copied (“grabbed”) by unauthorized people.

Following are the basic details of several compatible transmitters. The possible applications for each push-button are indicated in each drawing.

A. MCT-234
‘Keyfob’ transmitter. You can program the AUX (auxiliary) button to perform various tasks, in accordance with the user’s needs.

Pressing AWAY and HOME together for 2 sec. initiates PANIC alarm.

Pressing AWAY and HOME together for 2 sec. initiates Latchkey arming.

B. MCT-231 / 201*
(N.A. in North America)
Single-button pendant units. The MCT-231 (Code-Secure) and the MCT-201 (PowerCode) can be enrolled to perform functions as shown. Both units look alike.
C. MCT-134 / 104*  
(N.A. in North America)  
4-button hand-held units.  
MCT-134 (CodeSecure) can replace the MCT-234 keyfob.  
MCT-104 (PowerCode) can perform emergency and non-alarm functions. Both units look alike.

D. MCT-132 / 102*  
(N.A. in North America) 2-button units. MCT-132 (CodeSecure) can perform functions as shown. MCT-102 (PowerCode) can perform emergency and non-alarm tasks. Both units look alike.

E. MCT-131 / 101*  
(N.A. in North America)  
Single-button units. The MCT-131 (CodeSecure) and the MCT-101 (PowerCode) can be enrolled to perform functions as shown. Both units look alike.

F. MCT-211*  
Water-proof, wrist-worn Power-Code transmitter.  
Can be enrolled to perform emergency or non-alarm functions.

* Not UL listed.

E3 PowerMaxComplete Compatible WL Siren  
The MCS-700/710 wireless siren can be integrated with the PowerMaxComplete in areas in which wiring action is difficult or impossible. The MCS-700/710 is a fully supervised, 2-way communication device (it includes a receiver, to receive activation commands from the alarm system, and a transmitter to periodically transmit its status signal to the alarm system).  
When an identifiable activation command is received from the PowerMaxComplete, the siren activates its sounder and the flash light (strobe light every 1.5 seconds).

E4. PowerMaxComplete Compatible GSM Modem  
The internal / external GSM modem enables the PowerMaxComplete system to operate over a cellular network.

E5. Optional Speech Box  
The external Speech Box (optional) provides the PowerMaxComplete with two-way voice communication.
Industry Canada Declaration

This product meets the applicable Industry Canada technical specifications/Le présent matériel est conforme aux spécifications techniques applicables d'Industrie Canada.

The Ringer Equivalence Number is an indication of the maximum number of devices allowed to be connected to a telephone interface. The termination on an interface may consist of any combination of devices subject only to the requirement that the sum of the RENs of all the devices does not exceed five/L'indice d'équivalence de la sonnerie (IES) sert à indiquer le nombre maximal de terminaux qui peuvent être raccordés à une interface téléphonique. La terminaison d'une interface peut consister en une combinaison quelconque de dispositifs, à la seule condition que la somme d'indices d'équivalence de la sonnerie de tous les dispositifs n'excède pas 5.

The Ringer Equivalence Number (REN) for this terminal equipment is 0.3B.
WARRANTY

Visonic Limited (the "Manufacturer") warrants this product only (the "Product") to the original purchaser only (the "Purchaser") against defective workmanship and materials under normal use of the Product for a period of twelve (12) months from the date of shipment by the Manufacturer.

This warranty is absolutely unconditional upon the Product having been properly installed, maintained and operated under conditions of normal use in accordance with the Manufacturers recommended installation and operational instructions. Products which have become defective for any other reason, according to the Manufacturer’s discretion, such as improper installation, failure to follow recommended installation and operational instructions, neglect, vandal disease, misuse or operation, accidental damage, attention or tampering, or repair by anyone other than the Manufacturer, are not covered by this Warranty.

The Manufacturer does not represent that the Product may not be compromised and/or circumvented or that the Product will prevent any death and/or personal injury and/or damage to property resulting from burglary, robbery, fire or otherwise, or that the Product will in all cases provide adequate warning or protection. The Product, under normal use, may not prevent death and/or personal injury and/or damage to property resulting from burglary, robbery, fire or otherwise, or that the Product will in all cases provide adequate warning or protection.

OBLIGATIONS OR LIABILITIES, WHETHER WRITTEN, ORAL, EXPRESS OR IMPLIED, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, OR OTHERWISE. IN NO EVENT SHALL THE MANUFACTURER BE LIABLE TO ANYONE FOR ANY CONSEQUENTIAL OR INCIDENTAL DAMAGES FOR BREACH OF THIS WARRANTY OR ANY OTHER WARRANTIES WHATSOEVER, AS AFORESAID.

This Warranty is in addition to and does not affect your legal rights. Any provision in this warranty which is contrary to the Law in the state or country were the Product is supplied shall not apply.

This Warranty is exclusive to the original Purchaser and is not assignable.

The Manufacturers obligations under this Warranty are limited solely to repair and/or replace at theManufacturer’s discretion any Product or part thereof that may prove defective. Any repair and/or replacement shall not extend the original Warranty period. The Manufacturer shall not be responsible for any consequential or reinstatement costs. To exercise this Warranty the Product must be returned to the Manufacturer freight pre-paid and insured. All freight and insurance costs are the responsibility of the Purchaser and are not included in this Warranty.

The Manufacturer shall IN NO EVENT BE LIABLE FOR ANY SPECIAL, INDIRECT, INCIDENTAL, CONSEQUENTIAL OR PURCHASE DAMAGES OR FOR LOSS, DAMAGE, OR EXPENSE, INCLUDING LOSS OF USE, PROFIT, REVENUE, OR GOODWILL, DIRECTLY OR INDIRECTLY ARISING FROM PURCHASER’S USE OR INABILITY TO USE THE PRODUCT, OR FOR LOSS OR DESTRUCTION OF OTHER PROPERTY OR FROM ANY OTHER CAUSE, EVEN IF MANUFACTURER HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

The Manufacturer SHOULD HAVE NO LIABILITY FOR ANY DEATH, PERSONAL AND/OR BODILY INJURY AND/OR DAMAGE TO PROPERTY OR OTHER LOSS WHETHER DIRECT, INDIRECT, INCIDENTAL, CONSEQUENTIAL OR OTHERWISE, BASED ON A CLAIM THAT THE PRODUCT FAILED TO FUNCTION.

However, if the Manufacturer is held liable, whether directly or indirectly, for any loss or damage arising under this limited warranty, THE MANUFACTURER’S MAXIMUM LIABILITY (IF ANY) SHALL NOT IN ANY CASE EXCEED THE PURCHASE PRICE OF THE PRODUCT, which shall be fixed as liquidated damages and not as a penalty, and shall be the complete and exclusive remedy against the Manufacturer.

When accepting the delivery of the Product, the Purchaser agrees to the said conditions of sale and warranty and recognizes having been informed of:

Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages, so these limitations may not apply under certain circumstances.

Warning: The user must follow the Manufacturer’s installation and operational instructions including testing the Product and its whole system at least once a week and to take all necessary precautions for his/her safety and the protection of his/her property.

Visonic Limited (the "Manufacturer") warrants this product only (the "Product") to the original purchaser only (the "Purchaser") against defective workmanship and materials under normal use of the Product for a period of twelve (12) months from the date of shipment by the Manufacturer.

This warranty is absolutely unconditional upon the Product having been properly installed, maintained and operated under conditions of normal use in accordance with the Manufacturers recommended installation and operational instructions. Products which have become defective for any other reason, according to the Manufacturer’s discretion, such as improper installation, failure to follow recommended installation and operational instructions, neglect, vandal disease, misuse or operation, accidental damage, attention or tampering, or repair by anyone other than the Manufacturer, are not covered by this Warranty.

The Manufacturer does not represent that the Product may not be compromised and/or circumvented or that the Product will prevent any death and/or personal injury and/or damage to property resulting from burglary, robbery, fire or otherwise, or that the Product will in all cases provide adequate warning or protection. The Product, under normal use, may not prevent death and/or personal injury and/or damage to property resulting from burglary, robbery, fire or otherwise, or that the Product will in all cases provide adequate warning or protection.

This Warranty is in addition to and does not affect your legal rights. Any provision in this warranty which is contrary to the Law in the state or country were the Product is supplied shall not apply.

This Warranty is exclusive to the original Purchaser and is not assignable.

The Manufacturers obligations under this Warranty are limited solely to repair and/or replace at theManufacturer’s discretion any Product or part thereof that may prove defective. Any repair and/or replacement shall not extend the original Warranty period. The Manufacturer shall not be responsible for any consequential or reinstatement costs. To exercise this Warranty the Product must be returned to the Manufacturer freight pre-paid and insured. All freight and insurance costs are the responsibility of the Purchaser and are not included in this Warranty.

The Manufacturer shall IN NO EVENT BE LIABLE FOR ANY SPECIAL, INDIRECT, INCIDENTAL, CONSEQUENTIAL OR PURCHASE DAMAGES OR FOR LOSS, DAMAGE, OR EXPENSE, INCLUDING LOSS OF USE, PROFIT, REVENUE, OR GOODWILL, DIRECTLY OR INDIRECTLY ARISING FROM PURCHASER’S USE OR INABILITY TO USE THE PRODUCT, OR FOR LOSS OR DESTRUCTION OF OTHER PROPERTY OR FROM ANY OTHER CAUSE, EVEN IF MANUFACTURER HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

The Manufacturer SHOULD HAVE NO LIABILITY FOR ANY DEATH, PERSONAL AND/OR BODILY INJURY AND/OR DAMAGE TO PROPERTY OR OTHER LOSS WHETHER DIRECT, INDIRECT, INCIDENTAL, CONSEQUENTIAL OR OTHERWISE, BASED ON A CLAIM THAT THE PRODUCT FAILED TO FUNCTION.

However, if the Manufacturer is held liable, whether directly or indirectly, for any loss or damage arising under this limited warranty, THE MANUFACTURER’S MAXIMUM LIABILITY (IF ANY) SHALL NOT IN ANY CASE EXCEED THE PURCHASE PRICE OF THE PRODUCT, which shall be fixed as liquidated damages and not as a penalty, and shall be the complete and exclusive remedy against the Manufacturer.

When accepting the delivery of the Product, the Purchaser agrees to the said conditions of sale and warranty and recognizes having been informed of:

Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages, so these limitations may not apply under certain circumstances.

Warning: The user must follow the Manufacturer’s installation and operational instructions including testing the Product and its whole system at least once a week and to take all necessary precautions for his/her safety and the protection of his/her property.
